ABOUT THE INSTITUTION

A nation's growth is in proportion to education and intelligence spread among the masses. Having this idealistic vision, two great philanthropists late. S.P. Nallamuthu Gounder and Late. Arutchelver Padmabhushan Dr.N.Mahalingam formed an organization called Pollachi Kalvi Kazhagam, which started NGM College in 1957, to impart holistic education with an objective to cater to the higher educational needs of those who wish to aspire for excellence in knowledge and values. The College has achieved greater academic distinctions with the introduction of autonomous system from the academic year 1987-88. The college has been Re-Accredited by NAAC and it is ISO 9001 : 2015 Certified Institution. The total student strength is around 6000. Having celebrated its Diamond Jubilee in 2017, the college has blossomed into a premier Post-Graduate and Research Institution, offering 26 UG, 12 PG, 13 M.Phil and 10 Ph.D Programmes, apart from Diploma and Certificate Courses. The college has been ranked within Top 100 (72nd Rank) in India by NIRF 2021.

ABOUT CONFERENCE

The International conference on “Emerging Trends in Science and Technology (ETIST-2021)” is being jointly organized by Departments of Biological Science, Physical Science and Computational Science - Nallamuthu Gounder Mahalingam College, Pollachi along with ISTE, CSI, IETE, IEE & RIYASA LABS on 27th OCT 2021. The Conference will provide common platform for faculties, research scholars, industrialists to exchange and discuss the innovative ideas and will promote to work in interdisciplinary mode.

ABSTRACT

The purpose of this paper is to introduce a new class of functions called weakly δP_S -continuous functions by using δP_S -open sets in topological spaces. Some properties and characterizations of weakly δP_S -continuous functions are found.

KEYWORDS: Almost δP_S -continuous and Weakly Pre-continuous Functions

1. INTRODUCTION

The class of δ -open subsets of a topological space was first introduced by Veliko [22] in 1968. Munshi [11] initiated and studied the concept of supercontinuous mappings in 1982. Masshour et al [10] introduced the concept of precontinuous and weak precontinuous mappings in 1982. Since then many authors defined the various forms of weakly continuous mappings.

In 2020, Vidhyapriya et al., [23] defined a new class of open sets namely δP_S -open sets, combining the concepts of δ -preopen and semi-closed sets. In this paper the author defined weakly δP_S -continuous functions using δP_S -continuous [24], almost δP_S -continuous [25] and precontinuous functions. Further their properties and comparisons are studied.

2. PRELIMINARIES

Definition 2.1. A subset A of a space X is said to be

- a) Preopen [10] if $A \subseteq \text{int}(cl(A))$
- b) Semi-open [8] if $A \subseteq cl(\text{int}(A))$
- c) Regular open [21] if $A = \text{int}(cl(A))$
- d) θ -open [22] if for each $x \in A$ there exists an open set G such that $x \in G \subseteq clG \subseteq A$
- e) θ -semi-open [4] if for each $x \in A$, there exists a semi-open set G such that $x \in G \subseteq clG \subseteq A$
- f) δ -preopen [17] if $A \subseteq \text{Int}(\delta cl(A))$

- The closure and interior of A with respect to X are denoted by $cl(A)$ and $\text{int}(A)$ respectively.
- The intersection of particular class of closed sets of X containing A is called the corresponding closure of A .
- The union of particular class of open sets of X contained in A is called the corresponding interior of A .
- The family of all preopen (resp. Semi-open, regular open, θ -open, θ -semi-open,) subsets of X is denoted by $PO(X)$ (resp. $SO(X)$, $RO(X)$, $\theta O(X)$, $\theta SO(X)$, $\delta PO(X)$).
- The complement of a preopen (resp. Semi-open, regular open, δ -open, θ -open, δ -preopen, θ -semi-open, δ -preopen) is said to be preclosed (resp. Semi-closed, regular closed, θ -closed, θ -semiclosed, δ -preclosed).

- The family of all preclosed [10] (resp. Semi-closed, regular closed, θ -closed, θ -semiclosed, δ -preclosed) subsets of X is denoted by $PC(X)$ (resp. $SC(X)$, $RC(X)$, $\theta C(X)$, $\theta SC(X)$, $\delta PC(X)$).

Definition 2.2[23]: A δ -preopen subset A of a space X is called a δP_S -open set if for each $x \in A$, there exists a semi-closed set F such that $x \in F \subseteq A$.

Definition 2.3: A function $f: (X, \tau) \rightarrow (Y, \sigma)$ is said to be precontinuous [10] (resp. super continuous [11]) if the inverse image of each open subset of Y is preopen (resp. δ -open) in X .

Definition 2.4: A function $f: (X, \tau) \rightarrow (Y, \sigma)$ is said to be almost P_S -continuous [5] (resp. almost precontinuous [12], almost α -continuous [14] and almost continuous in the sense of Singal and Singal [20]) if for each $x \in X$ and each open set V of Y containing $f(x)$, there exists a δP_S -open (resp. preopen, α -open and open) set U of X containing x such that $f(U) \subseteq \text{int}cl(V)$.

Definition 2.5: A function $f: (X, \tau) \rightarrow (Y, \sigma)$ is said to be almost δP_S -continuous [25] (resp., almost strongly θ -continuous [13] and θ -irresolute [6]) if the inverse image of each regular open subset of Y is δP_S -open (resp., θ -open and intersection of regular open sets) in X .

Definition 2.6: A function $f: (X, \tau) \rightarrow (Y, \sigma)$ is said to be δP_S -continuous [24] (resp. precontinuous [10] and semi-continuous [8]) if the inverse image of each open subset of Y is δP_S -open (resp. preopen and semi-open) in X .

Definition 2.7: A function $f: (X, \tau) \rightarrow (Y, \sigma)$ is said to be δ -continuous [15] (resp. θ -continuous [3]) if for each $x \in X$ and each open set V of Y containing $f(x)$, there exists an open set U of X containing x such that $f(\text{int}clU) \subseteq \text{IntCl}V$ (resp. $f(clU) \subseteq clV$).

Definition 2.8: A function $f: (X, \tau) \rightarrow (Y, \sigma)$ is said to be weakly continuous [12] (resp. weakly α -continuous [16], weakly pre-continuous [7] and weakly δ -precontinuous [15]) if for each $x \in X$ and each open set V of Y containing $f(x)$, there exists a open (resp. α -open, preopen and δ -preopen) set U of X containing x such that $f(U) \subseteq clV$.

Definition 2.9: A function $f: (X, \tau) \rightarrow (Y, \sigma)$ is said to be S -continuous [27] if for every $F \in RC(Y)$, $f^{-1}(F)$ is the union of regular closed sets of X .

Definition 2.10: A function $f: (X, \tau) \rightarrow (Y, \sigma)$ is almost open [19] if $f(U) \subseteq \text{int}(cl(f(U)))$ for each open subset U of X .

Definition 2.11. A space X is said to be

- Extremally disconnected [1] if the closure of every open set of X is open in X .
- Locally indiscrete [2] if every open subset of X is closed.
- Semi- T_1 [9] if to each pair of distinct points x, y of X , there exists a pair of semi-open sets, one containing x but not y and the other containing y but not x .
- Semi-regular [28] if for any open set U of X and each point $x \in U$, there exists a regular open set V of X such that $x \in V \subseteq U$.
- Almost regular [18] if for any regular closed set F of X and a point $x \notin F$, there exist disjoint open sets U and V such that $F \subseteq U$ and $x \in V$.

Lemma 2.12[23]. A subset A of a space X is δP_S -open if and only if A is a δ -preopen set and A is a union of semi-closed sets.

Proposition 2.13 [23]. If a space X is semi- T_1 , then $\delta P_S O(X) = PO(X)$.

Proposition 2.14[23]. If a topological space (X, τ) is locally indiscrete, then $\delta P_S O(X) = \tau$.

Lemma 2.15[23]. For any subset A of a space X . If $A \in \theta SO(X)$ and $A \in PO(X)$, then $A \in \delta P_S O(X)$

Lemma 2.16[23]. Let (X, τ) be any extremally disconnected space. If $A \in \theta SO(X)$ then $A \in \delta P_S O(X)$

Proposition 2.17[23]. Let (Y, τ_Y) be a subspace of a space (X, τ) . If $A \in \delta P_S O(Y, \tau_Y)$ and $Y \in RO(X, \tau)$, then $A \in \delta P_S O(X, \tau)$.

Corollary 2.18[23]. If $A \in \delta P_S O(X)$ and B is either open or regular semi-open subset of X , then $A \cap B \in \delta P_S O(B)$.

Proposition 2.19. Let A be a subset of a topological space (X, τ) , then the following statements are true:

- a) If $A \in SO(X)$, then $\delta P_S Cl(A) = cl(A)$ [26]
- b) If $A \in \tau$, then $cl_\theta(A) = cl(A)$ [22].

Proposition 2.20[24]. If $f: (X, \tau) \rightarrow (Y, \sigma)$ is a continuous and an open function and V is a δP_S -open set of Y , then $f^{-1}(V)$ is a δP_S -open set of X .

Proposition 2.21[8]. Let $f: (X, \tau) \rightarrow (Y, \sigma)$ be a function and X is a locally indiscrete space. Then f is almost δP_S -continuous if and only if f is almost continuous.

Corollary 2.22[25]. If $f: (X, \tau) \rightarrow (Y, \sigma)$ is almost δP_S -continuous function if and only if f is almost continuous where X is locally indiscrete space.

Proposition 2.23 [25]. If $f: (X, \tau) \rightarrow (Y, \sigma)$ is an almost δP_S -continuous function and Y is semi-regular. Then f is δP_S -continuous.

The following results can be proved easily.

Proposition 2.24. If $f: (X, \tau) \rightarrow (Y, \sigma)$ is almost δ -precontinuous and Y is semi-regular, then f is precontinuous.

Proposition 2.25. If $f: (X, \tau) \rightarrow (Y, \sigma)$ is almost continuous and Y is semi-regular, then f is continuous.

Proposition 2.26[23]. A function $f: (X, \tau) \rightarrow (Y, \sigma)$ is weakly continuous if and only if $cl f^{-1}(V) \subseteq f^{-1}(cl V)$ for each open subset V of Y .

Proposition 2.27[18]. A function $f: (X, \tau) \rightarrow (Y, \sigma)$ is almost-open if and only if $f^{-1}(cl V) \subseteq cl f^{-1}(V)$ for each open subset V of Y .

Proposition 2.28[18]. A function $f: (X, \tau) \rightarrow (Y, \sigma)$ is almost-open and almost continuous if and only if $cl f^{-1}(V) = f^{-1}(cl V)$ for each open subset V of Y .

3. WEAKLY δP_S - CONTINUOUS FUNCTIONS

In this section, we introduce the concept of weakly δP_S -continuous functions by using δP_S -open sets. We give some characterizations of weakly δP_S -continuous functions with several relations between this function and other types of continuous functions and spaces

Definition 3.1. A function $f: (X, \tau) \rightarrow (Y, \sigma)$ is called weakly δP_S -continuous if for each $x \in X$ and each open set V of Y containing $f(x)$, there exists a δP_S -open set U of X containing x such that $f(U) \subseteq \delta cl(V)$. [For an open set δ -closure and closure coincide [21]. Hence in the above definition we can have $f(U) \subseteq cl(V)$).

Lemma 3.2. The following results supervene from their definitions directly:

- a) Every almost δP_S -continuous functions is weakly δP_S -continuous.
- b) Every weakly δP_S -continuous function is weakly δ -pre-continuous.
- c) Every weakly P_S -continuous function is weakly δP_S -continuous.

Proof: a) Let $f: (X, \tau) \rightarrow (Y, \sigma)$ be almost δP_S -continuous. Let $x \in X$ and each open set V of Y containing $f(x)$. Since f is almost δP_S -continuous, there exists a δP_S -open set U of X contained in x such that $f(U) \subseteq \text{int}(cl(V))$

We know that $\text{int}(cl(V)) \subseteq cl(V)$

Hence $f(U) \subseteq cl(V)$

b) Let $f: (X, \tau) \rightarrow (Y, \sigma)$ be weakly δP_S -continuous. Let $x \in X$ and V be an open set in Y containing x . Since f is weakly δP_S -continuous, there exists a δP_S -open set V contained in $f(x)$ such that $f(U) \subseteq V$. Since every δP_S -open set is δP -open set f is weakly δ -precontinuous.

c) Follows from the fact that every P_S -open set is δP_S -open set.

Therefore from the above Proposition we have:

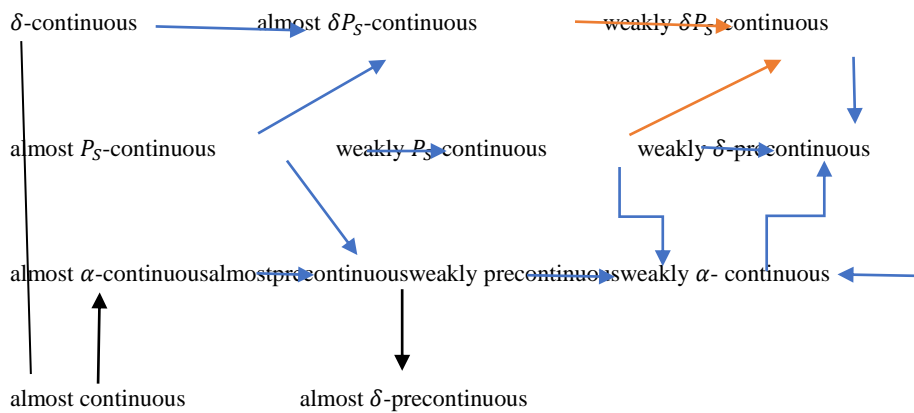

FIGURE 3.1

In the sequel, we shall show that none of the implications concerning weakly δP_S -continuity in Figure 3.1 is reversible.

Example 3.3. Let $X = \{a, b, c, d\}$ with the two topologies $\tau = \{X, \emptyset, \{c\}, \{a,b\}, \{a,b,c\}\}$ and $\sigma = \{X, \emptyset, \{a\}, \{c\}, \{a,b\}, \{a,c\}, \{a,b,c\}, \{a,c,d\}\}$ then $\delta P_S O(X, \tau) = \{\emptyset, X, \{c\}, \{a, b\}, \{a, b, c\}\}$. Let $f: (X, \tau) \rightarrow (X, \sigma)$ be the identity function. Then f is weakly δP_S -continuous, but it is not almost δP_S -continuous, because $\{a\}$ is an open set in (X, σ) containing $f(a) = a$, but there exist no δP_S -open set U in (X, τ) containing a such that $a \in f(U) \subseteq \text{IntCl}\{a\} = \{a\}$.

Example 3.4. Let $X = \{a, b, c, d\}$ with the two topologies $\tau = \{\emptyset, X, \{a\}, \{b\}, \{a,b\}\}$ and $\sigma = \{X, \emptyset, \{a\}, \{c\}, \{a, b\}, \{a, c\}, \{a, b, c\}, \{a, c, d\}\}$; then $\delta P_S O(X, \tau) = \{X, \emptyset, \{a\}, \{b\}, \{a, b\}, \{a, b, c\}, \{a, b, d\}\}$. Let $f: (X, \tau) \rightarrow (X, \sigma)$ be a function defined as follows: $f(a) = a, f(b) = f(c) = b$ and $f(d) = d$. Then f is weakly δP_S -continuous. However f is not weakly P_S -continuous since, an open set $\{a\}$ in (X, σ) containing $f(\{a\}) = a$, but there exist no P_S -open set U in (X, τ) containing a such that $f(\{d\}) = a \in f(U) \subseteq \text{int cl}\{a\} = \{a\}$ as $P_S O(X, \tau) = \{X, \emptyset\}$.

Example 3.5. Let X, τ, σ be same as in Example 3.3. Then f is weakly δ -precontinuous, but it is not weakly δP_S -continuous.

Remark 3.6. We notice that every identity function is weakly δP_S -continuous and a function $f: (X, \tau) \rightarrow (Y, \sigma)$ is weakly δP_S -continuous if either X is discrete or Y is indiscrete.

Proof: Case-(i) X is discrete

Proof: When X is discrete, (ie.,) $\tau = \mathcal{P}(X)$. Hence for every $x \in X$, $\{x\}$ is a δP_S -open in X .

Therefore, the δP_S -open set $U = \{x\}$ containing x such that $f(U) = f(\{x\}) = f(x) \in V \subseteq cl(V)$. Thus f is weakly δP_S -continuous

Case –(ii) Y is indiscrete

Proof: When Y is indiscrete, $\sigma = \{Y, \emptyset\}$ then $\delta P_S O(\sigma) = \{Y, \emptyset\}$. Any open set V in σ is Y . and $cl(V) = Y$.

Hence for any $U, f(U) \subseteq Y = cl(V)$

$\therefore f$ is weakly δP_S -continuous.

Proposition 3.7. If a function $f: (X, \tau) \rightarrow (Y, \sigma)$ is weakly δP_S -continuous, then for each $x \in X$ and each θ -open set V of Y containing $f(x)$, there exists a δP_S -open set U in X containing x such that $f(U) \subseteq V$.

Proof. Let $x \in X$ and let V be any θ -open set of Y

containing $f(x)$. Then for each $f(x) \in V$, there exists an open set G containing $f(x)$ such that $G \subseteq Cl(G) \subseteq V$. Since f is weakly δP_S -continuous, there exists a δP_S -open set U of X containing x such that $f(U) \subseteq Cl(G) \subseteq V$.

This completes the proof.

Corollary 3.8. If a function $f: (X, \tau) \rightarrow (Y, \sigma)$ is weakly δP_S -continuous, then for each $x \in X$ and each θ -open set V of Y containing $f(x)$, there exists a semi-closed set F in X containing x such that $f(F) \subseteq V$.

Proof. Let $x \in X$ and let V be any θ -open set of Y containing $f(x)$. Since f is weakly δP_S -continuous, then by Proposition 3.7, there exists a δP_S -open set U in X containing x such that

$f(U) \subseteq V$. Since U is a δP_S -open set in X , then for each $x \in U$, there exists a semi-closed set F of X such that $x \in F \subseteq U$. Therefore, we obtain $f(F) \subseteq f(U) \subseteq V$. Hence $f(F) \subseteq V$.

Proposition 3.9. Let $f: (X, \tau) \rightarrow (Y, \sigma)$ be a function. If for each $x \in X$ and each regular closed set R of Y containing $f(x)$, there exists a δP_S -open set U in X containing x such that $f(U) \subseteq R$, then f is weakly δP_S -continuous.

Proof. Let $x \in X$ and let V be any open set of Y containing $f(x)$. Then put $R = cl(V)$ which is a regular closed set of Y containing $f(x)$. By hypothesis, there exists a δP_S -open set U in X containing x such that $f(U) \subseteq R = cl(V)$. Hence f is weakly δP_S -continuous.

Proposition 3.10. If a function $f: (X, \tau) \rightarrow (Y, \sigma)$ is weakly δP_S -continuous, then the inverse image of each θ -open set of Y is a δP_S -open set in X .

Proof. Let V be any θ -open set in Y . We have to show that $f^{-1}(V)$ is a δP_S -open set in X . Let $x \in f^{-1}(V)$. Then $f(x) \in V$. Since f is weakly δP_S -continuous, then by Proposition 3.7, there exists a δP_S -open set U of X containing x such that $f(U) \subseteq V$, which implies that $x \in U \subseteq f^{-1}(V)$. Therefore, $f^{-1}(V)$ is a δP_S -open set in X .

Corollary 3.11. If a function $f: (X, \tau) \rightarrow (Y, \sigma)$ is weakly δP_S -continuous, then the inverse image of each θ -closed set of Y is a δP_S -closed set in X .

Proposition 3.12. Let $f: (X, \tau) \rightarrow (Y, \sigma)$ be a function. If $f^{-1}(cl(V))$ is a δP_S -open set in X for each open set V in Y , then f is weakly δP_S -continuous.

Proof. Let $x \in X$ and let V be any open set of Y containing $f(x)$. Then $x \in f^{-1}(V) \subseteq f^{-1}(cl(V))$. By hypothesis, we have $f^{-1}(cl(V))$ is a δP_S -open set in X containing x . Therefore, we obtain $f(f^{-1}(cl(V))) \subseteq cl(V)$. Hence f is weakly δP_S -continuous.

Corollary 3.13. Let $f: (X, \tau) \rightarrow (Y, \sigma)$ be a function. If $f^{-1}(\text{int}(F))$ is a δP_S -closed set in X for each closed set F in Y , then f is weakly δP_S -continuous.

Proposition 3.14. Let $f: (X, \tau) \rightarrow (Y, \sigma)$ be a function. If the inverse image of each regular closed set of Y is a δP_S -open set in X , then f is weakly δP_S -continuous.

Proof. Let V be any open set of Y . Then $\text{cl}(V)$ is a regular closed set in Y . By hypothesis, we have $f^{-1}(\text{cl}(V))$ is a δP_S -open set in X . Therefore, by Proposition 3.12, f is weakly δP_S -continuous.

Corollary 3.15. Let $f: (X, \tau) \rightarrow (Y, \sigma)$ be a function. If the inverse image of each regular open set of Y is a δP_S -closed set in X , then f is weakly δP_S -continuous.

Proposition 3.16. If a function $f: (X, \tau) \rightarrow (Y, \sigma)$ is weakly δP_S -continuous, then for each $x \in X$ and each open set V of Y containing $f(x)$, there exists a semi-closed set F in X containing x such that $f(F) \subseteq \text{cl}(V)$.

Proof. Let $x \in X$ and let V be any open set of Y containing $f(x)$. Since f is weakly δP_S -continuous, then there exists a δP_S -open set U of X containing x such that $f(U) \subseteq \text{cl}(V)$. Since U is δP_S -open set, then for each $x \in U$, there exists a semi-closed set F of X such that $x \in F \subseteq U$. Therefore, we have $f(F) \subseteq \text{cl}(V)$.

The following result is a characterization of weakly δP_S -continuous functions:

Proposition 3.17. For a function $f: (X, \tau) \rightarrow (Y, \sigma)$, the following statements are equivalent:

- f is weakly δP_S -continuous.
- $\delta P_S \text{cl} f^{-1}(\text{int} \text{cl}(B)) \subseteq f^{-1}(\text{cl}(B))$ for each $B \subseteq Y$
- $f^{-1}(\text{int}(B)) \subseteq \delta P_S \text{int} f^{-1}(\text{cl}(\text{int}(B)))$ for each $B \subseteq Y$
- $f^{-1}(\text{int}(\text{cl}(V))) \subseteq \delta P_S \text{int} f^{-1}(\text{cl}(V))$ for each open set V of Y
- $f^{-1}(V) \subseteq \delta P_S \text{int}(f^{-1}(\text{cl}(V)))$ for each regular open set V of Y .
- $\delta P_S(\text{cl}(f^{-1}(\text{int}(F)))) \subseteq f^{-1}(F)$, for each regular closed set F of Y .
- $\delta P_S(\text{cl}(f^{-1}(\text{int}(F)))) \subseteq f^{-1}(\text{cl}(\text{int}(F)))$, for each closed set F of Y .
- $\delta P_S(\text{cl}(f^{-1}(V))) \subseteq f^{-1}(\text{cl}(V))$, for each open set V of Y .
- $f^{-1}(\text{int}(F)) \subseteq \delta P_S(\text{int}(f^{-1}(F)))$, for each closed set F of Y .

Proof. (a) \Rightarrow (b). Let B be any subset of Y . Assume that $x \notin f^{-1}(\text{cl}(B))$. Then $f(x) \notin \text{cl}(B)$ and there exists an open set V containing $f(x)$ such that $V \cap B = \emptyset$, hence $\text{cl}(V) \cap \text{int}(\text{cl}(B)) = \emptyset$. By (a), there exists a δP_S -open set U of X containing x such that $f(U) \subseteq \text{cl}(V)$. Therefore, we have $f(U) \cap \text{int}(\text{cl}(B)) = \emptyset$ which implies that $U \cap f^{-1}(\text{int}(\text{cl}(B))) = \emptyset$ and hence $x \notin \delta P_S(\text{cl}(f^{-1}(\text{int}(\text{cl}(B)))))$. Therefore, we obtain $\delta P_S(\text{cl}(f^{-1}(\text{int}(\text{cl}(B)))) \subseteq f^{-1}(\text{cl}(B))$.

(b) \Rightarrow (c). Let B be any subset of Y . Then apply (b) to $Y \setminus B$ we obtain $\delta P_S \text{cl} f^{-1}(\text{int} \text{cl}(Y \setminus B)) \subseteq f^{-1}(\text{cl}(Y \setminus B)) \Rightarrow \delta P_S \text{cl} f^{-1}(\text{int}(Y \setminus \text{int} B)) \subseteq f^{-1}(Y \setminus \text{int} B) \Rightarrow \delta P_S \text{cl} f^{-1}(Y \setminus \text{cl} \text{int} B) \subseteq f^{-1}(Y \setminus \text{int} B) \Rightarrow \delta P_S \text{cl}(X \setminus f^{-1}(\text{cl} \text{int} B)) \subseteq X \setminus f^{-1}(\text{int} B) \Rightarrow X \setminus \delta P_S \text{int}(f^{-1}(\text{cl} \text{int} B)) \subseteq X \setminus f^{-1}(\text{int} B) \Rightarrow f^{-1}(\text{int} B) \subseteq \delta P_S \text{int} f^{-1}(\text{cl} \text{int} B)$. Therefore, we obtain $f^{-1}(\text{int} B) \subseteq \delta P_S \text{int} f^{-1}(\text{cl} \text{int} B)$.

(c) \Rightarrow (d). Let V be any open set of Y . Then apply (c) to $\text{cl}(V)$ we obtain $f^{-1}(\text{int} \text{cl}(V)) \subseteq \delta P_S \text{int} f^{-1}(\text{cl} \text{int} \text{cl}(V)) = \delta P_S \text{int} f^{-1}(\text{cl}(V))$. Therefore, we obtain $f^{-1}(\text{int} \text{cl}(V)) \subseteq \delta P_S \text{int} f^{-1}(\text{cl}(V))$.

(d) \Rightarrow (e). Let V be any regular open set of Y . Then V is an open set of Y . By (d), we have $f^{-1}(V) = f^{-1}(\text{int} \text{cl}(V)) \subseteq \delta P_S \text{int} f^{-1}(\text{cl}(V))$. Therefore, we obtain $f^{-1}(V) \subseteq \delta P_S \text{int} f^{-1}(\text{cl}(V))$.

(e) \Rightarrow (f). Let F be any regular closed set of Y . Then $Y \setminus F$ is a regular open set of Y . By (e), we have $f^{-1}(Y \setminus F) \subseteq$

$\delta P_S \text{int} f^{-1}(cl(Y \setminus F)) \Rightarrow X \setminus f^{-1}(F) \subseteq \delta P_S \text{int} f^{-1}(Y \setminus \text{int} F) \Rightarrow X \setminus f^{-1}(F) \subseteq \delta P_S \text{int}(X \setminus f^{-1}(\text{int} F))$
 $\Rightarrow X \setminus f^{-1}(F) \subseteq X \setminus \delta P_S cl f^{-1}(\text{int} F) \Rightarrow \delta P_S cl f^{-1}(\text{int} F) \subseteq f^{-1}(F)$. Hence $\delta P_S cl f^{-1}(\text{int} F) \subseteq f^{-1}(F)$.

(f) \Rightarrow (g). Let F be any closed set of Y . Then $cl \text{int}(F)$ is a regular closed set of Y . By (f) we have $\delta P_S cl f^{-1}(\text{int} cl \text{int}(F)) = \delta P_S cl f^{-1}(\text{int} F) \subseteq f^{-1}(cl \text{int}(F))$. Therefore, we obtain $\delta P_S cl f^{-1}(\text{int} F) \subseteq f^{-1}(cl \text{int}(F))$.

(g) \Rightarrow (h). Let V be any open set of Y . Then by (g) we have $\delta P_S cl f^{-1}(V) \subseteq \delta P_S cl f^{-1}(\text{int} cl V) \subseteq f^{-1}(cl \text{int} cl V) = f^{-1}(cl V)$. Therefore, $\delta P_S cl f^{-1}(V) \subseteq f^{-1}(cl V)$.

(h) \Rightarrow (i). Let F be any closed set of Y . Then $Y \setminus F$ is an open set of Y . By (h), we have $\delta P_S cl f^{-1}(Y \setminus F) \subseteq f^{-1}(cl(Y \setminus F)) \Rightarrow \delta P_S cl(X \setminus f^{-1}(F)) \subseteq f^{-1}(Y \setminus \text{int} F) \Rightarrow X \setminus \delta P_S \text{int} f^{-1}(F) \subseteq X \setminus f^{-1}(\text{int} F) \Rightarrow f^{-1}(\text{int} F) \subseteq \delta P_S \text{int} f^{-1}(F)$. Therefore, $f^{-1}(\text{int} F) \subseteq \delta P_S \text{int} f^{-1}(F)$.

(i) \Rightarrow (a). Let x be any point of X and let V be any open set in Y containing $f(x)$. Then $x \in f^{-1}(V)$ and $cl V$ is a closed set in Y . By (i), we have $x \in f^{-1}(V) \subseteq f^{-1}(\text{int} cl V) \subseteq \delta P_S \text{int} f^{-1}(cl V)$. Put $U = \delta P_S \text{int} f^{-1}(cl V)$. Then we obtain $x \in U \subseteq \delta P_S O(X)$ and $f(U) \subseteq cl V$. Therefore, f is weakly δP_S -continuous.

Proposition 3.18. If a function $f: (X, \tau) \rightarrow (Y, \sigma)$ is discontinuous, then f is weakly δP_S -continuous.

Proof. Let V be any open set of Y . Since f is discontinuous, then $f^{-1}(V)$ is an open set and hence it is a semi-open set. By Proposition 2.19(a), we have $\delta P_S cl f^{-1}(V) = cl f^{-1}(V)$. Also, since f is discontinuous, then $cl f^{-1}(V) \subseteq f^{-1}(cl(V))$. Therefore, we obtain that $\delta P_S cl f^{-1}(V) \subseteq f^{-1}(cl V)$ and hence by Proposition 3.17, f is weakly δP_S -continuous.

Another characterization theorem of weakly δP_S -continuous functions is the following:

Proposition 3.19. For a function $f: (X, \tau) \rightarrow (Y, \sigma)$, the following statements are equivalent:

- a) f is weakly δP_S -continuous.
- b) $f(\delta P_S cl A) \subseteq cl_0 f(A)$, for each subset A of X .
- c) $\text{int}_0 f(A) \subseteq f(\delta P_S \text{int} A)$, for each subset A of X .
- d) $f^{-1}(\text{int}_0 B) \subseteq \delta P_S \text{int} f^{-1}(B)$, for each subset B of Y .
- e) $\delta P_S cl f^{-1}(B) \subseteq f^{-1}(cl_0 B)$, for each subset B of Y .

Proof. (a) \Rightarrow (b). Let A be a subset of X . Suppose that $f(\delta P_S cl A) \not\subseteq cl_0 f(A)$. Then there exists $y \in f(\delta P_S cl A)$ such that $y \notin cl_0 f(A)$, then there exists an open set G in Y containing y such that $cl G \cap f(A) = \emptyset$. If $f^{-1}(y) = \emptyset$, then there is nothing to prove. Suppose that x be any arbitrary point of $f^{-1}(y)$, so $f(x) \in G$. Since G is an open set in Y , by (a), there exists a δP_S -open set H in X containing x such that $f(H) \subseteq cl G$. Therefore, we have $f(H) \cap f(A) = \emptyset$. Then $y \notin \delta P_S cl(f(A)) \Rightarrow x \notin \delta P_S cl(A)$. Hence $y \notin \delta P_S cl(A)$ which is a contradiction. Therefore, we have $f(\delta P_S cl A) \subseteq cl_0 f(A)$.

(b) \Rightarrow (c). Let A be any subset of X . Then apply (b) to $X \setminus A$ we obtain $f(\delta P_S cl(X \setminus A)) \subseteq cl_0 f(X \setminus A) \Rightarrow f(X \setminus \delta P_S \text{int} A) \subseteq cl_0(Y \setminus f(A)) \Rightarrow Y \setminus f(\delta P_S \text{int} A) \subseteq Y \setminus \text{int}_0 f(A) \Rightarrow \text{int}_0 f(A) \subseteq f(\delta P_S \text{int} A)$. Therefore, we obtain that $\text{int}_0 f(A) \subseteq f(\delta P_S \text{int} A)$.

(c) \Rightarrow (d). Let B be a subset of Y . Then $f^{-1}(B)$ is a subset of X . By (c), we have $\text{Int}_0 f(f^{-1}(B)) \subseteq f(\delta P_S \text{int} f^{-1}(B))$. Then $\text{int}_0 B \subseteq f(\delta P_S \text{int} f^{-1}(B))$ and hence $f^{-1}(\text{int}_0 B) \subseteq \delta P_S \text{int} f^{-1}(B)$.

(d) \Rightarrow (e). Let B be any subset of Y . Then apply (d) to $Y \setminus B$ we obtain $f^{-1}(\text{Int}_0(Y \setminus B)) \subseteq \delta P_S \text{int} f^{-1}(Y \setminus B) \Rightarrow f^{-1}(Y \setminus cl_0 B) \subseteq \delta P_S \text{int}(X \setminus f^{-1}(B)) \Rightarrow X \setminus f^{-1}(cl_0 B) \subseteq X \setminus \delta P_S cl f^{-1}(B) \Rightarrow \delta P_S cl f^{-1}(B) \subseteq f^{-1}(cl_0 B)$. Therefore, we obtain $\delta P_S cl f^{-1}(B) \subseteq f^{-1}(cl_0 B)$.

(e) \Rightarrow (a). Let V be any open set of Y . By (e), we have $\delta P_S cl f^{-1}(V) \subseteq f^{-1}(cl_0 V)$. By Proposition 2.19 (b), we

have $\delta P_S cl f^{-1}(V) \subseteq f^{-1}(cl(V))$.

Therefore, by Proposition 3.17, f is weakly δP_S -continuous.

Proposition 3.20. A function $f: (X, \tau) \rightarrow (Y, \sigma)$ is weakly δP_S -continuous if and only if $\delta P_S cl f^{-1}(int cl(B)) \subseteq f^{-1}(cl(B))$ for each subset B of Y

Proof. Necessity. Let B be any subset of Y . Assume that $x \notin f^{-1}(cl_\theta B)$. Then $f(x) \notin cl_\theta B$ and hence there exists an open set H containing $f(x)$ such that $B \cap cl H = \emptyset$. This implies that $cl_\theta B \cap H = \emptyset$ and so $H \subseteq Y \setminus cl_\theta B$ and hence $cl H \subseteq cl(Y \setminus cl_\theta B)$. Since f is weakly δP_S -continuous, there exists a δP_S -open set U of X containing x such that $f(U) \subseteq cl H \subseteq cl(Y \setminus cl_\theta B) = Y \setminus int cl_\theta B$. This implies that $f(U) \cap int(cl_\theta B) = \emptyset$ and hence $U \cap f^{-1}(int cl_\theta B) = \emptyset$. Then $x \notin \delta P_S cl f^{-1}(int cl_\theta B)$. Therefore, $\delta P_S cl f^{-1}(int cl_\theta B) \subseteq f^{-1}(cl_\theta B)$.

Sufficiency. Let V be any open set of Y . Then by hypothesis and Proposition 2.19(b), we have $\delta P_S cl(f^{-1}(int cl(V))) = \delta P_S cl f^{-1}(int(int cl_\theta(V))) \subseteq f^{-1}(cl_\theta(V))$. Therefore, $\delta P_S cl(f^{-1}(int cl(V))) \subseteq f^{-1}(cl(V))$. Hence by Proposition 3.17(b), f is weakly δP_S -continuous.

From Proposition 3.20, we obtain that:

Corollary 3.21. A function $f: (X, \tau) \rightarrow (Y, \sigma)$ is weakly δP_S -continuous if and only if $f^{-1}(int_\theta(B)) \subseteq \delta P_S(int(f^{-1}(cl(int_\theta(B))))$ for each subset B of Y .

Proposition 3.22. A function $f: (X, \tau) \rightarrow (Y, \sigma)$ is weakly δP_S -continuous if and only if $f^{-1}(V) \subseteq \delta P_S(int(f^{-1}(cl(V))))$ for each open set V of Y .

Proof. Necessity. Let f be weakly δP_S -continuous and let V be any open set of Y . Then $V \subseteq int(cl(V))$. Therefore, by Proposition 3.17(b), $f^{-1}(V) \subseteq f^{-1}(int(cl(V))) \subseteq \delta P_S(int(f^{-1}(cl(V))))$. Hence $f^{-1}(V) \subseteq \delta P_S(int(f^{-1}(cl(V))))$.

Sufficiency. Let V be any regular open set of Y . Then V is an open set of Y . By hypothesis, we have $f^{-1}(V) \subseteq \delta P_S f^{-1}(cl(V))$. Therefore, by Proposition 3.17(c), f is weakly δP_S -continuous.

From Proposition 3.22, we obtain that:

Corollary 3.23. A function $f: (X, \tau) \rightarrow (Y, \sigma)$ is weakly δP_S -continuous if and only if $\delta P_S cl(f^{-1}(int(F))) \subseteq f^{-1}(F)$ for each closed set F of Y .

Proposition 3.24. A function $f: (X, \tau) \rightarrow (Y, \sigma)$ is weakly δP_S -continuous if and only if $\delta P_S cl(f^{-1}(V)) \subseteq f^{-1}(\delta P_S(cl(V)))$ for each open set V of Y .

Proof. Necessity. Let V be any open set of Y . Since f is weakly δP_S -continuous, then by Proposition 3.17(h), we have $\delta P_S cl(f^{-1}(V)) \subseteq f^{-1}(\delta P_S(cl(V)))$. Since V is an open set and hence V is a semi-open set. Therefore, by Proposition 2.19(a), we obtain $\delta P_S(cl(f^{-1}(V))) \subseteq f^{-1}(\delta P_S(cl(V)))$.

Sufficiency. Let F be any closed set of Y . Then $int(F)$ is an open set in Y . By hypothesis, we have $\delta P_S(cl(f^{-1}(int(F)))) \subseteq f^{-1}(\delta P_S(cl(int(F))))$. Since $int(F)$ is a semi-open set, then by Proposition 2.19(a), $\delta P_S(cl(f^{-1}(int(F)))) \subseteq f^{-1}(cl(int(F)))$. Therefore, by Proposition 3.17(g), f is weakly δP_S -continuous.

From Proposition 3.24, we obtain that:

Corollary 3.25. A function $f: (X, \tau) \rightarrow (Y, \sigma)$ is weakly δP_S -continuous if and only if $f^{-1}(\delta P_S(int F)) \subseteq \delta P_S(int(f^{-1}(F)))$ for each closed set F of Y .

Proposition 3.26. If a function $f: (X, \tau) \rightarrow (Y, \sigma)$ is weakly δP_S -continuous, then $f: (X, \tau) \rightarrow (Y, \sigma_\theta)$ is δP_S -continuous.

Proof. Let $H \in \sigma_\theta$, then H is θ -open set in (Y, σ) . Since $f: (X, \tau) \rightarrow (Y, \sigma)$ is weakly δP_S -continuous, then by

Proposition 3.10, $f^{-1}(H)$ is a δP_S -open set in X . Therefore, $f: (X, \tau) \rightarrow (Y, \sigma_\theta)$ is δP_S -continuous.

Proposition 3.27. Let X be a locally indiscrete space. Then the function $f: (X, \tau) \rightarrow (Y, \sigma)$ is weakly δP_S -continuous if and only if $f: (X, \tau) \rightarrow (Y, \sigma_\theta)$ is continuous.

Proof. Let $H \in \sigma_\theta$, then H is θ -open set in (Y, σ) . Since $f: (X, \tau) \rightarrow (Y, \sigma)$ is weakly δP_S -continuous, then by Proposition 3.10, $f^{-1}(H)$ is a δP_S -open set in X . Since X is a locally indiscrete space, then by Proposition 2.14, $f^{-1}(H)$ is open set in X . Therefore, $f: (X, \tau) \rightarrow (Y, \sigma_\theta)$ is continuous.

Proposition 3.28. Let $f: (X, \tau) \rightarrow (Y, \sigma)$ be a function. Let \mathcal{B} be any basis for τ_θ in Y . If f is weakly δP_S -continuous, then for each $B \in \mathcal{B}$, $f^{-1}(B)$ is a δP_S -open set of X .

Proof. Suppose that f is weakly δP_S -continuous. Since each $B \in \mathcal{B}$ is a θ -open subset of Y , therefore, by Proposition 3.10, $f^{-1}(B)$ is a δP_S -open subset of X .

4. PROPERTIES AND COMPARISONS

In this section, we give some properties of weakly δP_S -continuous functions and we compare them with other types of continuous functions.

Proposition 4.1. Let $f: (X, \tau) \rightarrow (Y, \sigma)$ be weakly δP_S -continuous function. If A is a regular semi-open subset of X , then the restriction $f|_A: A \rightarrow Y$ is weakly δP_S -continuous in the subspace A .

Proof. Let $x \in A$ and V be an open set of Y containing $f(x)$. Since f is weakly δP_S -continuous, there exists a δP_S -open set U of X containing x such that $f(U) \subseteq cI V$. Since A is a regular semi-open subset of X , by Corollary 2.18, $A \cap U$ is a δP_S -open subset of A containing x and $(f|_A)(A \cap U) = f(A \cap U) \subseteq f(U) \subseteq cI V$. This shows that $f|_A$ is weakly δP_S -continuous.

Corollary 4.2. Let $f: (X, \tau) \rightarrow (Y, \sigma)$ be a weakly δP_S -continuous function. If A is a regular open subset of X , then the restriction $f|_A: A \rightarrow Y$ is weakly δP_S -continuous in the subspace A .

Proof. Since every regular open set is regular semi-open, this is an immediate consequence of Proposition 4.1.

Proposition 4.3. Let $f: (X, \tau) \rightarrow (Y, \sigma)$ be a function. If for each $x \in X$, there exists a regular open set A of X containing x such that the restriction $f|_A: A \rightarrow Y$ is weakly δP_S -continuous, then f is weakly δP_S -continuous.

Proof. Let $x \in X$, then by hypothesis, there exists a regular open set A containing x such that $f|_A: A \rightarrow Y$ is weakly δP_S -continuous. Let V be any open set of Y containing $f(x)$, there exists a δP_S -open set U in A containing x such that $(f|_A)(U) \subseteq cI V$. Since A is regular open set, by Proposition 2.17, U is δP_S -open set in X and hence $f(U) \subseteq cI V$. This shows that f is weakly δP_S -continuous.

As an immediate consequence of Corollary 4.2 and Proposition 4.3, we obtain that:

Corollary 4.4. Let $\{U_\alpha : \alpha \in \Delta\}$ be a regular open cover of a topological space X . A function $f: (X, \tau) \rightarrow (Y, \sigma)$ is weakly δP_S -continuous if and only if the restriction $f|_{U_\alpha}: U_\alpha \rightarrow Y$ is weakly δP_S -continuous for each $\alpha \in \Delta$.

Remark 4.5. If $f: (X, \tau) \rightarrow (Y, \sigma)$ is a weakly δP_S -continuous function and A, B are any subsets of X . Then the restriction $f|_A: A \rightarrow f(A)$ need not be weakly δP_S -continuous in general. Moreover, $f|(A \cup B): A \cup B \rightarrow f(A \cup B)$ is not always weakly δP_S -continuous even if $f|_A: A \rightarrow f(A)$, $f|_B: B \rightarrow f(B)$ and f are all weakly δP_S -continuous.

Proposition 4.6. If $X = R \cup S$, where R and S are regular open sets and $f: (X, \tau) \rightarrow (Y, \sigma)$ is a function such that both $f|_R$ and $f|_S$ are weakly δP_S -continuous, then f is weakly δP_S -continuous.

Proof. Let $x \in X$ and V be an open set of Y containing $f(x)$. Since $f|_R$ and $f|_S$ are weakly δP_S -continuous, there exist δP_S -open sets U of R and W of S with $x \in U$ and $x \in W$, such that $(f|_R)(U) \subseteq cI V$ and $(f|_S)(W) \subseteq cI V$.

Then $f(U \cup W) = (f|R)(U) \cup (f|S)(W) \subseteq clV$. Since R and S are regular open sets in X , then by Proposition 2.17, U and W are δP_S -open sets in X . Since union of two δP_S -open sets is δP_S -open, then $U \cup W$ is a δP_S -open set of X containing x . Therefore, f is weakly δP_S -continuous. In general, if $X = \cup\{K_\alpha : \alpha \in \Delta\}$, where each K_α is a regular open set and $f: (X, \tau) \rightarrow (Y, \sigma)$ is a function such that the restriction $f|K_\alpha$ is weakly δP_S -continuous for each α , then f is weakly δP_S -continuous.

Proposition 4.7. Let $X = R_1 \cup R_2$, where R_1 and R_2 are regular open sets in X . Let $f: R_1 \rightarrow Y$ and $g: R_2 \rightarrow Y$ be weakly δP_S -continuous. If $f(x) = g(x)$ for each $x \in R_1 \cap R_2$, then $h: R_1 \cup R_2 \rightarrow Y$ such that

$$h(x) = \begin{cases} f(x) & \text{if } x \in R_1 \text{ and } x \notin R_2 \\ g(x) & \text{if } x \in R_2 \text{ and } x \notin R_1 \\ f(x) = g(x) & \text{if } x \in R_1 \cap R_2 \end{cases}$$

is weakly δP_S -continuous.

Proof. Let $x \in X$ and V be an open set of Y containing $h(x)$. Then $x \in R_1 \cup R_2$ and V is an open set of Y containing $f(x)$ and $g(x)$. Since f is weakly δP_S -continuous, there exists a δP_S -open set U of X containing x such that $f(U) \subseteq clV$. Then $f^{-1}(clV)$ is a δP_S -open set of R_1 containing x . But R_1 is a regular open set in X , then by Proposition 2.17, $f^{-1}(clV)$ is a δP_S -open set of X containing x . Similarly, $f^{-1}(clV)$ is a δP_S -open set in R_2 and hence, a δP_S -open set in X . Since union of two δP_S -open sets is δP_S -open. Therefore, $h^{-1}(clV) = f^{-1}(clV) \cup g^{-1}(clV)$ is a δP_S -open set in X and it is clear that $h(h^{-1}(clV)) \subseteq clV$. Hence h is weakly δP_S -continuous.

Proposition 4.8. Let $f: (X, \tau) \rightarrow (Y, \sigma)$ be weakly δP_S -continuous surjection and A be a regular semi-open subset of X . If f is an open function, then the function $g: A \rightarrow f(A)$, defined by $g(x) = f(x)$ for each $x \in A$, is weakly δP_S -continuous.

Proof. Putting $H = f(A)$. Let $x \in A$ and V be any open set in H containing $g(x)$. Since H is open in Y and V is open in H , then V is open in Y . Since f is weakly δP_S -continuous, there exists a δP_S -open set U in X containing x such that $f(U) \subseteq clV$. Taking $W = U \cap A$, since A is either open or a regular semi-open subset of X , then by Corollary 2.18, W is a δP_S -open set in A containing x and $g(W) \subseteq cl_Y V \cap H = cl_H V$. Then $g(W) \subseteq cl_H V$. This shows that g is weakly δP_S -continuous.

Proposition 4.9. Let $f: (X, \tau) \rightarrow (Y, \sigma)$ be weakly δP_S -continuous function and for each $x \in X$. If Y is any subset of Z containing $f(x)$, then $f: (X, \tau) \rightarrow (Z, \eta)$ is weakly δP_S -continuous.

Proof. Let $x \in X$ and V be any open set of Z containing $f(x)$. Then $V \cap Y$ is open in Y containing $f(x)$. Since $f: (X, \tau) \rightarrow (Y, \sigma)$ is weakly δP_S -continuous, there exists a δP_S -open set U of X containing x such that $f(U) \subseteq cl(V \cap Y)$ and hence $f(U) \subseteq cl(V)$. Therefore, $f: (X, \tau) \rightarrow (Z, \eta)$ is weakly δP_S -continuous.

We shall obtain some conditions for which the composition of two functions is weakly δP_S -continuous:

Proposition 4.10. Let $f: (X, \tau) \rightarrow (Y, \sigma)$ and $g: (Y, \sigma) \rightarrow (Z, \eta)$ be functions. Then the composition function $g \circ f: (X, \tau) \rightarrow (Z, \eta)$ is weakly δP_S -continuous if and g satisfy one of the following conditions:

- f is δP_S -continuous and g is weakly continuous.
- f is weakly δP_S -continuous and g is almost strongly θ -continuous.
- f is weakly δP_S -continuous and g is θ -continuous.
- f is weakly δP_S -continuous and g is continuous.
- f is continuous and open and g is weakly δP_S -continuous.

Proof. a) Let $x \in X$ and W be an open set of

Z containing $g(f(x))$. Since g is weakly continuous, there exists an open set V of Y containing $f(x)$ such that $g(V) \subseteq cl(W)$ (i.e., $f(x) \in V \subseteq g^{-1}(cl(W))$). Hence $g^{-1}(cl(W))$ is open in Y containing $f(x)$. Since f is weakly δP_S -continuous, there exists a δP_S -open set U of X containing x such that $f(U) \subseteq g^{-1}(cl(W))$, from Definition 2.6. Therefore, we obtain $(g \circ f)(U) = g(f(U)) \subseteq cl(W)$. Hence $g \circ f$ is weakly δP_S -continuous.

b) Let W be any regular open subset of Z . Since g is almost strongly θ -continuous from the Definition 2.5, $g^{-1}(W)$ is θ -open subset of Y . Since f is weakly δP_S -continuous, then by Proposition 3.10, $(g \circ f)^{-1}(W) = f^{-1}(g^{-1}(W))$ is a δP_S -open subset in X . Therefore, $g \circ f$ is almost δP_S -continuous, [by Proposition 3.10(e) of 24] and hence it is weakly δP_S -continuous, by Proposition 3.2(a).

c) Let $x \in X$, and W be an open set of Z containing $g(f(x))$. Since g is θ -continuous, there exists an open set V of Y containing $f(x)$ such that $g(cl(V)) \subseteq cl(W)$, by definition 2.7. Since f is weakly δP_S -continuous, there exists a δP_S -open set U of X containing x such that $f(U) \subseteq cl(V)$. Hence $g(f(U)) \subseteq g(cl(V)) \subseteq cl(W)$. Therefore, $g \circ f$ is weakly δP_S -continuous.

d) Let $x \in X$ and W be an open set of Z containing $g(f(x))$. Since g is continuous, $g^{-1}(W)$ is an open set of Y containing $f(x)$. Since f is weakly δP_S -continuous, there exists a δP_S -open set U of X containing x such that $f(U) \subseteq cl(g^{-1}(W))$. Also, since g is continuous, then we have $f(U) \subseteq g^{-1}(cl(W))$. This implies that $g(f(U)) \subseteq cl(W)$. Therefore, $g \circ f$ is weakly δP_S -continuous.

e) Let $x \in X$ and W be an open set of Z containing $g(f(x))$. Since g is weakly δP_S -continuous, there exists a δP_S -open set U of Y containing $f(x)$ such that $g(U) \subseteq cl(W)$. It is clear that $g^{-1}(cl(W))$ is a δP_S -open set of Y containing $f(x)$. Since f is continuous and open, then by Proposition 2.20, $f^{-1}(g^{-1}(cl(W))) = (g \circ f)^{-1}(cl(W))$ is a δP_S -open set in X containing x and clearly $(g \circ f)((g \circ f)^{-1}(cl(W))) \subseteq cl(W)$. Hence f is weakly δP_S -continuous.

Proposition 4.11. If $f: (X, \tau) \rightarrow (Y, \sigma)$ is a weakly δP_S -continuous function and Y is almost regular, then f is almost δP_S -continuous.

Proof. Let $x \in X$ and let V be any open set of Y containing $f(x)$. By the almost regularity of Y , there exists a regular open set G of Y such that $f(x) \in G \subseteq clG \subseteq int(clV)$ [18, Proposition 2.2]. Since f is weakly δP_S -continuous, there exists a δP_S -open set U of X containing x such that $f(U) \subseteq cl(G) \subseteq int(clV)$. Therefore, f is almost δP_S -continuous, from Definition 2.4.

Proposition 4.12. If $f: (X, \tau) \rightarrow (Y, \sigma)$ is a weakly δP_S -continuous function and Y is an extremally disconnected space, then f is almost δP_S -continuous.

Proof. Let $x \in X$ and let V be any open set of Y containing $f(x)$. Since f is weakly δP_S -continuous, there exists a δP_S -open set U of X containing x such that $f(U) \subseteq clV$. Since Y is extremally disconnected, from Definition 2.11(a) $cl(V)$ is open, (i.e., $cl(V) = int(cl(V))$), then $f(U) \subseteq int(cl(V))$. Therefore, f is almost δP_S -continuous.

Corollary 4.13. A function $f: (X, \tau) \rightarrow (Y, \sigma)$ is almost δP_S -continuous if and only if f is weakly δP_S -continuous and it satisfies one of the following properties:

- a) Y is almost regular.
- b) Y is extremally disconnected.

Proof. The proof follows from Proposition 3.2(a). The converse is proved in Proposition 4.11 and Proposition 4.12.

Corollary 4.14. Let $f: (X, \tau) \rightarrow (Y, \sigma)$ be a function and X is a locally indiscrete space. Then f is weakly δP_S -

continuous if and only if f is weakly continuous.

Proof. Follows from Proposition 2.14.

Corollary 4.15. If X is a locally indiscrete space and Y is either almost regular or an extremally disconnected space, the following statements are equivalent for a function $f: (X, \tau) \rightarrow (Y, \sigma)$:

- a) f is almost δP_S -continuous.
- b) f is weakly δP_S -continuous.
- c) f is weakly continuous.
- d) f is almost continuous.

Proof. (a) \Rightarrow (b) Follows from Proposition 3.2

(b) \Rightarrow (c) Follows from Corollary 4.14

(c) \Rightarrow (d) Follows from Corollary 4.12

(d) \Rightarrow (a) Since X is locally indiscrete, $\delta P_S O(X) = \tau$. Hence almost continuous function is a almost δP_S -continuous function, from Proposition 2.21.

Corollary 4.16. If Y is a regular space, the following statements are equivalent for a function $f: (X, \tau) \rightarrow (Y, \sigma)$:

- a) f is δP_S -continuous.
- b) f is almost δP_S -continuous.
- c) f is weakly δP_S -continuous.

Proof. Follows from Proposition 4.11 and Proposition 2.23 and the fact that every regular space is almost regular and semi-regular space.

Corollary 4.17. If X is a locally indiscrete space

and Y is a regular space, the following statements are equivalent for a function $f: (X, \tau) \rightarrow (Y, \sigma)$:

- a) f is δP_S -continuous.
- b) f is almost δP_S -continuous.
- c) f is weakly δP_S -continuous.
- d) f is weakly continuous.
- e) f is almost continuous.
- f) f is continuous.

Proof. Follows from Corollary 4.15, Corollary 4.16 and Proposition 2.25 and the fact that every regular space is almost regular and semi-regular space.

Proposition 4.18. Let $f: (X, \tau) \rightarrow (Y, \sigma)$ be a function and X is a semi- T_1 space. Then f is weakly δP_S -continuous if and only if f is weakly δ -precontinuous.

Proof. Follows from Proposition 2.13.

Corollary 4.19. If X is a semi- T_1 space and Y is either almost regular or an extremally disconnected space, the following statements are equivalent for a function $f: (X, \tau) \rightarrow (Y, \sigma)$:

- a) f is almost δP_S -continuous.
- b) f is weakly δP_S -continuous.
- c) f is weakly δ -precontinuous.
- d) f is almost δ -precontinuous.

Proof. Follows from Corollary 4.13, Proposition 4.18 and Proposition 2.22.

Corollary 4.20. If X is a semi- T_1 space and Y is a regular space, the following statements are equivalent for

a function $f: (X, \tau) \rightarrow (Y, \sigma)$:

- a) f is δP_S -continuous.
- b) f is almost δP_S -continuous.
- c) f is weakly δP_S -continuous.
- d) f is weakly δ -precontinuous.
- e) f is almost δ -precontinuous.
- f) f is δ -precontinuous.

Proof. Follows from Corollary 4.16, Corollary 4.19 and Proposition 2.24 and the fact that every regular space is almost regular and semi-regular space.

Proposition 4.21. If $f: (X, \tau) \rightarrow (Y, \sigma)$ is a semi-continuous function. Then f is weakly continuous if and only if f is weakly δP_S -continuous.

Proof. Necessity. Let V be any open set of Y . Since f is weakly continuous, by Proposition 2.26, $cl f^{-1}(V) \subseteq f^{-1}(cl V)$. Since f is semi-continuous, then $f^{-1}(V)$ is a semi-open set in X . Hence by Proposition 2.19(a), $\delta P_S cl f^{-1}(V) = cl f^{-1}(V)$. Therefore, we obtain $\delta P_S cl f^{-1}(V) \subseteq f^{-1}(cl V)$. Thus by Proposition 3.17(h), f is weakly δP_S -continuous.

Sufficiency. Let V be any open set in Y . Since f is weakly δP_S -continuous, by Proposition 3.17(h), $\delta P_S cl f^{-1}(V) \subseteq f^{-1}(cl V)$. Since f is semi-continuous, then $f^{-1}(V)$ is semi-open set of X . Hence by Proposition 2.19(a), we have $\delta P_S cl f^{-1}(V) = cl f^{-1}(V)$. Therefore, we obtain $cl f^{-1}(V) \subseteq f^{-1}(cl V)$. Thus by Proposition 2.26, f is weakly continuous.

Corollary 4.22.A function $f: (X, \tau) \rightarrow (Y, \sigma)$ is weakly δP_S -continuous if and only if f is weakly continuous if it satisfies one of the following properties:

- a) X is locally indiscrete space.
- b) f is semi-continuous.

Proof. Follows from Corollary 4.14 and Proposition 4.21.

Proposition 4.23. If $f: (X, \tau) \rightarrow (Y, \sigma)$ is weakly θ_S -continuous and weakly δ -precontinuous, then f is weakly δP_S -continuous.

Proof. Let $x \in X$ and let V be any open set of Y containing $f(x)$. Since f is weakly θ_S -continuous and weakly δ -precontinuous, then there exists a θ -semi-open and a δ -preopen set U of X containing x such that $f(U) \subseteq cl V$, respectively. Hence by Lemma 2.15, U is a δP_S -open set of X containing x such that $f(U) \subseteq cl V$. Therefore, f is weakly δP_S -continuous.

Proposition 4.24. Let $f: (X, \tau) \rightarrow (Y, \sigma)$ be a function and X be an extremally disconnected space. If f is weakly θ_S -continuous, then f is weakly δP_S -continuous.

Proof. Follows from Lemma 2.16.

Proposition 4.25. If $f: (X, \tau) \rightarrow (Y, \sigma)$ is weakly δ -precontinuous and either S -continuous or a θ -irresolute function, then f is weakly δP_S -continuous.

Proof. Let $x \in X$ and V be any open set of Y containing $f(x)$. Since f is weakly δ -precontinuous, there exists a δ -preopen set U of Y containing $f(x)$ such that $f(U) \subseteq cl V$. Then $f^{-1}(cl V)$ is a δ -preopen set of Y containing x . Since $cl V$ is a regular closed set of Y and f is either S -continuous or θ -irresolute, then $f^{-1}(cl V)$ is the union of regular closed sets of X and hence is the union of semi-closed sets of X . By Lemma 2.12, $f^{-1}(cl V)$ is a δP_S -

open set of X containing x and clearly $f(f^{-1}(clV)) \subseteq clV$. Hence f is weakly δP_S -continuous.

Corollary 4.26. Let $f: (X, \tau) \rightarrow (Y, \sigma)$ be either S -continuous or a θ -irresolute function. Then f is weakly δP_S -continuous if and only if f is weakly δ -precontinuous.

Proposition 4.27. If a function $f: (X, \tau) \rightarrow (Y, \sigma)$ is weakly δP_S -continuous and open, then $f(\delta P_S clV) \subseteq \delta P_S clf(V)$ for each open set V of X .

Proof. Let V be any open set of X . Since f is open, then $f(V)$ is an open set in Y . Since f is weakly δP_S -continuous, then by Proposition 3.24, we obtain that $\delta P_S clf^{-1}(f(V)) \subseteq f^{-1}(\delta P_S clf(V))$ which implies that $f(\delta P_S clV) \subseteq \delta P_S clf(V)$.

Corollary 4.28. If a function $f: (X, \tau) \rightarrow (Y, \sigma)$ is weakly δP_S -continuous and open, then $\delta P_S int f(F) \subseteq f(\delta P_S int(F))$ for each closed set F of X .

Proposition 4.29. If a function $f: (X, \tau) \rightarrow (Y, \sigma)$ is semi-continuous and almost open, then f is weakly δP_S -continuous if and only if $\delta P_S clf^{-1}(V) = f^{-1}(\delta P_S clV)$ for each open set V of Y .

Proof. Necessity. Let V be any open set of Y . Since f is weakly δP_S -continuous, then by Proposition 3.24, $\delta P_S clf^{-1}(V) \subseteq f^{-1}(\delta P_S clV)$. Since V is open, hence it is semi-open. Then by Proposition 2.19(a), $\delta P_S cl(V) = cl(V)$ which implies that $\delta P_S cl(V) \subseteq cl(V)$ and hence $f^{-1}(\delta P_S clV) \subseteq f^{-1}(clV)$. Since V is an open set of Y and f is almost open, then by Proposition 2.27, $f^{-1}(clV) \subseteq clf^{-1}(V)$. Therefore, we have $f^{-1}(\delta P_S clV) \subseteq f^{-1}(clV) \subseteq f^{-1}(V)$ and hence $f^{-1}(\delta P_S clV) \subseteq clf^{-1}(V)$. Since V is an open set of Y and f is semi-continuous, then $f^{-1}(V)$ is a semi-open set in X . Then by Proposition 2.19(a) we obtain that $f^{-1}(\delta P_S clV) \subseteq \delta P_S clf^{-1}(V)$. Therefore, we have $\delta P_S clf^{-1}(V) = f^{-1}(\delta P_S clV)$.

Sufficiency. Follows from Proposition 3.24.

Corollary 4.30. If a function $f: (X, \tau) \rightarrow (Y, \sigma)$ is weakly δP_S -continuous, semi-continuous and almost open, then $\delta P_S int f^{-1}(F) = f^{-1}(\delta P_S int F)$ for each closed set F of Y .

Proof. Follows from Proposition 4.29.

Corollary 4.31. If a function $f: (X, \tau) \rightarrow (Y, \sigma)$ is weakly δP_S -continuous, semi-continuous and almost open, then $clf^{-1}(V) = f^{-1}(clV)$ for each open set V of Y .

Proof. Follows from Proposition 4.29 and Proposition 2.19(a).

Corollary 4.32. Let $f: (X, \tau) \rightarrow (Y, \sigma)$ be an almost open function. If f is weakly δP_S -continuous and semi-continuous, then f is almost continuous and hence f is weakly continuous.

Proof. Follows from Proposition 4.31 and Proposition 2.28.
