## **ABOUT THE INSTITUTION**

A nation's growth is in proportion to education and intelligence spread among the masses. Having this idealistic vision, two great philanthropists late. S.P. Nallamuthu Gounder and Late. Arutchelver Padmabhushan Dr.N.Mahalingam formed an organization called Pollachi Kalvi Kazhagam, which started NGM College in 1957, to impart holistic education with an objective to cater to the higher educational needs of those who wish to aspire for excellence in knowledge and values. The College has achieved greater academic distinctions with the introduction of autonomous system from the academic year 1987-88. The college has been Re-Accredited by NAAC and it is ISO 9001 : 2015 Certified Institution. The total student strength is around 6000. Having celebrated its Diamond Jubilee in 2017, the college has blossomed into a premier Post-Graduate and Research Institution, offering 26 UG, 12 PG, 13 M.Phil and 10 Ph.D Programmes, apart from Diploma and Certificate Courses. The college has been ranked within Top 100 (72nd Rank) in India by NIRF 2021.

## **ABOUT CONFERENCE**

The International conference on “Emerging Trends in Science and Technology (ETIST-2021)” is being jointly organized by Departments of Biological Science, Physical Science and Computational Science - Nallamuthu Gounder Mahalingam College, Pollachi along with ISTE, CSI, IETE, IEE & RIYASA LABS on 27th OCT 2021. The Conference will provide common platform for faculties, research scholars, industrialists to exchange and discuss the innovative ideas and will promote to work in interdisciplinary mode.

## **EDITORIAL BOARD**

**Dr. V. Inthumathi**

Associate Professor & Head, Dept. of Mathematics, NGM College

**Dr. J. Jayasudha**

Assistant Professor, Dept. of Mathematics, NGM College

**Dr. R. Santhi**

Assistant Professor, Dept. of Mathematics, NGM College

**Dr. V. Chitra**

Assistant Professor, Dept. of Mathematics, NGM College

**Dr. S. Sivasankar**

Assistant Professor, Dept. of Mathematics, NGM College

**ABSTRACT.** The purpose of this paper is to introduce a new concept of functions called Almost  $\delta P_S$ -continuous functions. This class of functions is defined using new class of sets called  $\delta P_S$ -open sets in topological spaces. Some properties and characterizations of this function are obtained.

**Keywords.**  $\delta P_S$ -continuous, precontinuous, almost precontinuous functions.

### 1. INTRODUCTION

Velicko [23] was the first who introduced  $\delta$ -open sets in 1968, which plays an important role in study of various topological spaces. Considering this many authors defined a new class of sets in topological spaces. Vidhyapriya et al [24] introduced a new concept called  $\delta P_S$ -open sets in topological spaces. In this paper almost  $\delta P_S$ -continuous functions is defined by which various properties are obtained.

### 2. PRELIMINARIES

In a topological space  $X$  mean a topological space without any separation axiom. We recall the following definitions, notations and terminology.

**Definition 2.1.** A subset  $A$  of  $X$  is said to be

- a) preopen [12] if  $A \subseteq \text{IntCl}A$
- b) semi-open [10] if  $A \subseteq \text{ClInt}A$
- c)  $\alpha$ -open [15] if  $A \subseteq \text{IntClInt}A$
- d)  $\beta$ -open [1] if  $A \subseteq \text{ClIntCl}A$
- e) regular open [22] if  $A = \text{IntCl}A$
- f) regular semi-open [5] if  $A = \text{sIntsCl}A$
- g)  $\delta$ -preopen [20] if  $A \subseteq \text{Int}(\delta\text{Cl}(A))$

➤ The complement of a preopen (resp. semi-open,  $\alpha$ -open,  $\beta$ -open, regular open and regular semi-open) set is said to be preclosed (resp. semi-closed,  $\alpha$ -closed,  $\beta$ -closed, regular closed,  $\delta$ -preclosed and regular semi-open).

➤ The family of all preopen (resp. semi-open,  $\alpha$ -open, regular open, regular semi-open,  $\delta$ -preopen and regular closed) subsets of a topological space  $X$  is denoted by  $\text{PO}(X)$  (resp.  $\text{SO}(X)$ ,  $\alpha\text{O}(X)$ ,  $\text{RO}(X)$ ,  $\text{RSO}(X)$ ,  $\delta\text{PO}(X)$  and  $\text{RC}(X)$ ).

Vidhyapriya P<sup>\*1</sup>, Mathematics, Avinashilingam Institute for Home Science and Higher Education for Women, Coimbatore, Tamilnadu, India. E-mail: pvidhyapriya19@gmail.com  
Sivakamasundari K<sup>\*2</sup>, Mathematics, Avinashilingam Institute for Home Science and Higher Education for Women, Coimbatore, Tamilnadu, India.

- The closure (resp. interior) of a subset  $A$  of  $X$  is denoted by  $Cl A$  (resp.  $Int A$ ).

**Definition 2.2:** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is said to be

- a) precontinuous [12] (resp.,  $\delta$ -precontinuous) if the inverse image of each open subset of  $Y$  is preopen (resp.,  $\delta$ -preopen) in  $X$ .
- b) super continuous [13] if the inverse image of each open subset of  $Y$  is  $\delta$ -open in  $X$ .
- A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is said to be almost precontinuous [14] (resp. almost continuous in the sense of Singal and Singal [21]) if the inverse image of each regular open subset of  $Y$  is preopen (resp., opensets) in  $X$ .
- A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is said to be  $\delta$ -continuous [16] (resp., almost strongly  $\theta$ -continuous [18]) if for each  $x \in X$  and each open set  $V$  of  $Y$  containing  $f(x)$ , there exists an open set  $U$  of  $X$  containing  $x$  such that  $f(IntClU) \subseteq IntClV$  (resp.,  $f(ClU) \subseteq sClV$ ).

**Definition 2.3.** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is said to be irresolute [7] if the inverse image of each semi-open subset of  $Y$  is semi-open in  $X$ .

**Definition 2.4.** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is said to be weakly quasi-continuous [8] (resp.  $S$ -continuous [26]) if for every  $F \in RC(Y)$ ,  $f^{-1}(F) \in SO(X)$  (resp  $f^{-1}(F)$  is the union of regular closed sets of  $X$ ).

**Definition 2.5 [24].** A  $\delta$ -preopen subset  $A$  of a space  $X$  is called a  $\delta P_S$ -open set if for each  $x \in A$ , there exists a semi-closed set  $F$  such that  $x \in F \subseteq A$ .

**Definition 2.6 [23].** A subset  $A$  of a space  $X$  is called  $\delta$ -open (resp.,  $\theta$ -open) if for each  $x \in A$ , there exists an open set  $G$  such that  $x \in G \subseteq IntCl(G) \subseteq A$  (resp  $x \in G \subseteq ClG \subseteq A$ ).

- The intersection of all  $\delta P_S$ -closed (resp. preclosed, semi-closed,  $\alpha$ -closed,  $\delta$ -preclosed and  $\delta$ -closed) sets of  $X$  containing  $A$  is called the  $\delta P_S$ -closure (resp. preclosure, semi-closure,  $\alpha$ -closure,  $\delta$ -preclosure and  $\delta$ -closure) of  $A$  and is denoted by  $\delta P_S Cl A$  (resp.  $pCl A$ ,  $sCl A$ ,  $\alpha Cl A$ ,  $\delta pCl(A)$  and  $Cl_\delta A$ ).

- The union of all  $\delta P_S$ -open (resp. preopen, semi-open,  $\alpha$ -open,  $\delta$ -preopen and  $\delta$ -open) sets of  $X$  contained in  $A$  is called the  $\delta P_S$ -interior (resp. preinterior, semi-interior,  $\alpha$ -interior,  $\delta$ -preinterior and  $\delta$ -interior) of  $A$  and is denoted by  $\delta P_S Int A$  (resp.  $p Int A$ ,  $s Int A$ ,  $\alpha Int A$ ,  $\delta p Int(A)$  and  $Int_\delta A$ ).

**Proposition 2.7 [24].** A subset  $A$  of a space  $X$  is  $\delta P_S$ -open if and only if  $A$  is a  $\delta$ -preopen set and  $A$  is a union of semi-closed sets.

**Definition 2.8.** A space  $X$  is  $s$ -regular [3] (resp., semi-regular [19]) if for each  $x \in X$  and each open set  $G$  containing  $x$ , there exists a semi-open (resp., regular open) set  $H$  such that  $x \in H \subseteq sclH \subseteq G$  (resp.,  $x \in H \subseteq G$ ).

**Theorem 2.9 [21].** For a mapping  $f: (X, \tau) \rightarrow (Y, \sigma)$ , the following statements are equivalent:

- a)  $f$  is almost continuous at  $x \in X$
- b) For each regularly-open neighborhood  $M$  of  $f(x)$ , there is a neighborhood  $N$  of  $x$  such that  $f(N) \subseteq M$ .
- c) For each net  $\{x_\lambda\}_{\lambda \in D}$  converging to  $x$ , the net  $\{f(x_\lambda)\}_{\lambda \in D}$  is eventually in every regular open set containing  $f(x)$ .

**Definition 2.10.** A space  $X$  is said to be:

- a) Hyperconnected [6] if every non-empty open subset of  $X$  is dense.

- b) Locally indiscrete [6] if every open subset of  $X$  is closed.
- c) Semi- $T_1$ [11] if to each pair of distinct points  $x, y$  of  $X$ , there exists a pair of semi-open sets, one containing  $x$  but not  $y$  and the other containing  $y$  but not  $x$ .

**Proposition 2.11.** The following statements are true:

- a) A space  $X$  is semi- $T_1$  if and only if for any point  $x \in X$ , the singleton set  $\{x\}$  is semi-closed [11].
- b) If a space  $X$  is semi- $T_1$ , then  $\delta P_S O(X) = \delta P O(X)$  [24].
- c) If a topological space  $(X, \tau)$  is locally indiscrete space,  $\delta P_S O(X) = \tau$  [24].
- d) If a topological space  $(X, \tau)$  is  $s$ -regular, then  $\tau \subseteq \delta P_S O(X)$  [24].

**Lemma 2.12**[6]. a). If  $R \in RO(X)$  and  $P \in PO(X)$ , then  $R \cap P \in RO(P)$ .

- b). Let  $Y$  be a dense subspace of  $X$ . If  $O$  is regular open in  $Y$ , then  $O = Y \cap \text{int}(cl(O))$ .

**Proposition 2.13**[24]. The following properties are true:

- a) Let  $(Y, \tau_Y)$  be a subspace of a space  $(X, \tau)$ . If  $A \in \delta P_S O(X, \tau)$  and  $Y \in RO(X, \tau)$  then  $A \in \delta P_S O(Y, \tau_Y)$ .
- b) If either  $B \in RSO(X)$  or  $B$  is an  $\delta$ -open subspace of a space  $X$  and  $A \in \delta P_S O(X)$ , then  $A \cap B \in \delta P_S O(B)$ .
- c) Let  $(Y, \tau_Y)$  be a subspace of a space  $(X, \tau)$ . If  $A \in \delta P_S O(Y, \tau_Y)$  and  $Y \in RO(X, \tau)$ , then  $A \in \delta P_S O(X, \tau)$ .
- d) Let  $A$  and  $B$  be any subsets of a space  $X$ . If  $A \in \delta P_S O(X)$  and  $B \in RSO(X)$ , then  $A \cap B \in \delta P_S O(B)$ .

**Lemma 2.14.** The following statements are true:

- a) Let  $A$  be a subset of a space  $(X, \tau)$ . Then  $A \in PO(X, \tau)$  if and only if  $sClA = \text{Int}ClA$  [7].
- b) A subset  $A$  of a space  $(X, \tau)$  is  $\beta$ -open if and only if  $ClA$  is regular closed. [4].

**Lemma 2.15.** Let  $A$  be a subset of a topological space  $(X, \tau)$ , then the following statement are true:

- a) For each  $A \in SO(X)$ ,  $Cl_\delta A = Cl(A) = \delta P_S Cl(A) = pCl(A) = \alpha Cl(A)$  [25].
- b) If  $A \in \beta O(X)$ , then  $\alpha Cl(A) = Cl(A)$  [2].

**Definition 2.16**[24]. A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called  $\delta P_S$ -continuous at a point  $x \in X$  if for each  $x \in X$  and each open set  $V$  of  $Y$  containing  $f(x)$ , there exists a  $\delta P_S$ -open set  $U$  of  $X$  containing  $x$  such that  $f(U) \subseteq V$ . If  $f$  is  $\delta P_S$ -continuous at every point of  $X$ , then it is called  $\delta P_S$ -continuous. Equivalently, a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is  $\delta P_S$ -continuous if and only if  $f^{-1}(V)$  is  $\delta P_S$ -open set in  $X$  for each open set  $V$  in  $Y$ .

**Lemma 2.17**[14]. The following results can be proved easily:

- a) If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is almost precontinuous and  $Y$  is semi-regular, then  $f$  is precontinuous.
- b) If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is almost continuous and  $Y$  is semi-regular, then  $f$  is continuous.
- c) A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is almost precontinuous if and only if  $f^{-1}(V)$  is preopen set in  $X$ , for every  $\delta$ -open set  $V$  in  $Y$ .

**Theorem 2.18** [24]. If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is a continuous and open function and  $V$  is a  $\delta P_S$ -open set of  $Y$ , then  $f^{-1}(V)$  is a  $\delta P_S$ -open set of  $X$ .

**Theorem 2.19** [7]. A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is preopen if and only if  $f^{-1}(ClV) \subseteq Cl(f^{-1}(V))$ , for each semi-open set  $V$  of  $Y$ .

**Definition 2.20[9].** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called almost  $P_S$ -continuous at a point  $x \in X$  if for each open set  $V$  of  $Y$  containing  $f(x)$ , there exists a  $P_S$ -open set  $U$  of  $X$  containing  $x$  such that  $f(U) \subseteq \text{IntCl}V$ . If  $f$  is almost  $P_S$ -continuous at every point of  $X$ , then it is called almost  $P_S$ -continuous.

**Lemma 2.21[21].** Let  $A$  be a subset of a topological space  $(X, \tau)$ . Then  $\delta\text{-sCl}(\delta\text{-Int}(A)) = \text{Int}(\text{Cl}(\delta\text{-Int}(A)))$ , or equivalently,  $\delta\text{-sCl}(U) = \text{Int}(\text{Cl}(U))$  for each  $\delta$ -open set  $U$  of  $X$ .

**Proposition 2.22[9]:** If a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is  $\delta$ -continuous, then  $f$  is almost  $P_S$ -continuous.

### 3. Almost $\delta P_S$ -Continuous Functions

**Definition 3.1:** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is called almost  $\delta P_S$ -continuous function at a point  $x \in X$  if for each open set  $V$  of  $Y$  containing  $f(x)$ , there exists a  $\delta P_S$ -open set  $U$  of  $X$  containing  $x$  such that  $f(U) \subseteq \text{Int}(\text{Cl}(V))$ . If  $f$  is almost  $\delta P_S$ -continuous at every point of  $X$ , then it is called almost  $\delta P_S$ -continuous.

**Note 3.2.** For an open set  $\delta\text{Cl}(V) = \text{Cl}(V)$  [23]. Hence in the definition  $f(U) \subseteq \text{intcl}(V)$ .

**Proposition 3.3:** The following results supervene from their definitions directly:

- a) Every  $\delta P_S$ -continuous function is almost  $\delta P_S$ -continuous.
- b) Every almost  $P_S$ -continuous function is almost  $\delta P_S$ -continuous.

**Proof:** (a) Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be  $\delta P_S$ -continuous. Then for  $x \in X$  and  $V \in \sigma$  containing  $f(x)$  there exists a  $\delta P_S$ -open set  $U$  in  $X$  containing  $x$  such that  $f(U) \subseteq V$  (1)  $\longrightarrow$

Then  $V \subseteq \delta\text{cl}(V)$ . Since  $V$  is open,  $V = \text{int } V \subseteq \text{int } \delta\text{cl}(V)$  (2)  $\longrightarrow$

$\therefore$  From (1) & (2)  $V \subseteq \text{int}(\delta\text{Cl}(V))$

Hence from definition 3.1,  $f$  is almost  $\delta P_S$ -continuous function.

(b). Every almost  $P_S$ -continuous function is almost  $\delta P_S$ -continuous function

Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be almost  $P_S$ -continuous function. Then for  $x \in X$  and  $V \in \sigma$  containing  $f(x)$  there exists a  $\delta P_S$ -open set  $U$  in  $X$  containing  $x$  such that  $f(U) \subseteq \text{intcl}(V)$ . Since every  $P_S$ -open set is  $\delta P_S$ -open, from Definition 3.1,  $f$  is almost  $\delta P_S$ -continuous.

**Proposition 3.4:** If a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is  $\delta$ -continuous, then  $f$  is almost  $\delta P_S$ -continuous.

**Proof.** From Proposition 2.22, Every  $\delta$ -continuous is almost  $\delta P_S$ -continuous. From Proposition 3.3(b) every almost  $\delta P_S$ -continuous function is almost  $\delta P_S$ -continuous. Therefore, every  $\delta$ -continuous function is almost  $\delta P_S$ -continuous functions.

And we have

Super Continuous  $\longrightarrow$   $\delta$ -Continuous

The following examples substantiate the converse of Proposition 3.3(a) is generally not true.

**Example 3.5.** Let  $X = \{a, b, c\}$  with the two topologies  $\tau = \{X, \emptyset, \{a\}, \{b\}, \{a, b\}, \{a, c\}\}$  and  $\sigma = \{X, \emptyset, \{a\}, \{a, b\}\}$ ; then the  $\delta P_S O(X) = \{X, \emptyset, \{b\}, \{c\}, \{a, c\}, \{b, c\}\}$  with respect to  $\tau$ . Let  $f: (X, \tau) \rightarrow (X, \sigma)$  be the identity function, with  $f(a) = a, f(b) = b$  and  $f(c) = c$ , for  $a \in V = \{a\}$  or  $\{a, b\}$ , then there exists  $U = \{a, c\}$  such that  $f(U) = \{a, c\} = \text{int}(cl(\{a, c\})) = X$ . Then  $f$  is almost  $\delta P_S$ -continuous, but it is not  $\delta P_S$ -continuous, because  $f(U) = \{a, c\} = \text{int}cl \subseteq X$  but  $f(U) \not\subseteq \{a\}$  or  $\{a, b\}$ .

The following example substantiate the Proposition 3.3(b) is not true in general.

**Example 3.6.** Let  $X = \{a, b, c, d\}$  with the two topologies  $\tau = \{X, \emptyset, \{a, b\}, \{a, b, c\}, \{a, b, d\}\}$  and  $\sigma = \{X, \emptyset, \{a\}, \{c\}, \{a, b\}, \{a, c\}, \{a, b, c\}, \{a, c, d\}\}$ . Let  $f: (X, \tau) \rightarrow (X, \sigma)$  be defined by  $f(a) = f(b) = f(c) = c$  and  $f(d) = d$ , there exists  $\delta P_S O(X, \tau) = \{c\} \subseteq X$  such that  $f(U) \subseteq \text{int}cl(V)$ . but there exists no  $P_S O(X, \tau)$  in  $\tau$ , such that  $f(U) \subseteq \text{int}cl(V)$ . Hence  $f$  is almost  $\delta P_S$ -continuous but not almost  $P_S$ -continuous.

The following example shows that almost  $\delta P_S$ -continuous but not  $\delta$ -continuous.

**Example 3.7.** Let  $X = \{a, b, c, d\}$  with the two topologies  $\tau = \{X, \emptyset, \{a\}, \{b\}, \{a, b\}\}$  and  $\sigma = \{X, \emptyset, \{a\}, \{a, b\}, \{a, b, c\}, \{a, b, d\}\}$ ; Let  $f: (X, \tau) \rightarrow (X, \sigma)$  be identity functions for  $b \in X$  and  $V = \{b\} \in \sigma$  there exists  $U = \{a, b\}$  containing  $b$  which is  $\delta P_S$ -open in  $X$  such that  $f(U) = \{a, b\} \subseteq \text{int}(\delta Cl(V)) = \text{int}(X) = X$ . Here  $f$  is almost  $\delta P_S$ -continuous but not  $\delta$ -continuous. Since  $f(\text{int}(Cl(U))) = f(\text{int}(Cl\{a, b\})) = f(X) = Y \not\subseteq \text{int}(Cl(V)) = \text{int}(Cl(\{b\})) = \text{int}\{b, c, d\} = \emptyset$ .

**Lemma 3.8.** Let  $A$  be subset of a space  $(X, \tau)$ . Then  $A \in \delta PO(X, \tau)$  if and only if  $\delta sCl(A) = \text{int}(\delta Cl(A))$ .

**Proof:** Let  $A \in \delta PO(X, \tau)$ . Then

$$A \subseteq \text{int}(\delta Cl(A)) \Rightarrow \delta sCl(A) \subseteq \delta sCl(\text{int}(\delta Cl(A))) \quad \longrightarrow \quad (*)$$

Claim:  $\text{int}(\delta Cl(A)) \in \delta Sc(X, \tau)$

Proof: Let  $B = \text{int}(\delta Cl(A))$

$$\text{Then } \text{int}(B) = \text{int}(\text{int}(\delta Cl(A))) = \text{int}(\delta Cl(A)) = B \quad (1) \longrightarrow$$

Now  $B \subseteq \delta Cl(B) = \delta Cl(\text{int}(B))$  [from (1)]. Hence  $B \in \delta Cc(X, \tau)$ . Hence the claim

Substitute claim in (\*), we get,  $\delta sCl(A) \subseteq \delta sCl(\text{int}(\delta Cl(A))) = \text{int}(\delta Cl(A))$

In general,  $\text{int}(\delta Cl(A)) = \delta sCl(A)$ . Hence  $\delta(sCl(A)) = \text{int}(\delta Cl(A))$ .

**Proposition 3.9.** For a function  $f: (X, \tau) \rightarrow (Y, \sigma)$ , the following statements are equivalent:

- a)  $f$  is almost  $\delta P_S$ -continuous.
- b) For each  $x \in X$  and each  $\delta$ -open set  $V$  of  $Y$  containing  $f(x)$  there exists a  $\delta P_S$ -open set  $U$  in  $X$  containing  $x$  such that  $f(U) \subseteq \delta sCl(V)$ .

- c) For each  $x \in X$  and each regular open set  $V$  of  $Y$  containing  $f(x)$ , there exists a  $\delta P_S$ -open set  $U$  in  $X$  containing  $x$  such that  $f(U) \subseteq V$ .
- d) For each  $x \in X$  and each  $\delta$ -open set  $V$  of  $Y$  containing  $f(x)$ , there exists a  $\delta P_S$ -open set  $U$  in  $X$  containing  $x$  such that  $f(U) \subseteq V$ .

**Proof.** (a)  $\Rightarrow$  (b). Let  $x \in X$  and let  $V$  be any  $\delta$ -open set of  $Y$  containing  $f(x)$ . By (a), there exists a  $\delta P_S$ -open set  $U$  of  $X$  containing  $x$  such that  $f(U) \subseteq \text{Int} \delta Cl V$ . Since  $V$  is  $\delta$ -open, hence  $V$  is  $\delta$ -preopen set. Therefore, by Lemma 3.8,  $f(U) \subseteq \delta sCl V$ .

(b)  $\Rightarrow$  (c). Let  $x \in X$  and let  $V$  be any regular open set of  $Y$  containing  $f(x)$ . Then  $V$  is a  $\delta$ -open set of  $Y$  containing  $f(x)$ . By (b), there exists a  $\delta P_S$ -open set  $U$  in  $X$  containing  $x$  such that  $f(U) \subseteq \delta sCl(V)$ . Since  $V$  is regular open and hence is  $\delta$ -open set. Therefore, by Lemma 2.21,  $f(U) \subseteq \text{Int}(Cl(V))$ . Since  $V$  is regular open, then  $f(U) \subseteq V$ .

(c)  $\Rightarrow$  (d). Let  $x \in X$  and let  $V$  be any  $\delta$ -open set of  $Y$  containing  $f(x)$ . Then for each  $f(x) \in V$ , there exists an open set  $G$  containing  $f(x)$  such that  $G \subseteq \text{Int}(Cl(G)) \subseteq V$ . Since  $\text{Int}(Cl(G))$  is a regular open set of  $Y$  containing  $f(x)$ , by (c), there exists a  $\delta P_S$ -open set  $U$  in  $X$  containing  $x$  such that  $f(U) \subseteq \text{Int}(Cl(G)) \subseteq V$ .

(d)  $\Rightarrow$  (a). Let  $x \in X$  and let  $V$  be any open set of  $Y$  containing  $f(x)$ . Then  $\text{Int}(Cl(V))$  is  $\delta$ -open set of  $Y$  containing  $f(x)$ . By (d), there exists a  $\delta P_S$ -open set  $U$  in  $X$  containing  $x$  such that  $f(U) \subseteq \text{Int}(Cl(V))$ . But  $\text{Int} Cl(V) \subseteq \text{int} \delta Cl(V)$  [ $\because Cl(V) \subseteq \delta Cl(V)$  and  $A \subseteq B \Rightarrow \text{int}(A) \subseteq \text{int}(B)$ ]. Therefore,  $f$  is almost  $\delta P_S$ -continuous.

**Proposition 3.10.** For a function  $f: (X, \tau) \rightarrow (Y, \sigma)$ , the following statements are equivalent:

- a)  $f$  is almost  $\delta P_S$ -continuous.
- b)  $f^{-1}(\text{Int}(Cl(V)))$  is  $\delta P_S$ -open in  $X$ , for each open set  $V$  in  $Y$ .
- c)  $f^{-1}(Cl(\text{Int}(F)))$  is  $\delta P_S$ -closed set in  $X$ , for each closed set  $F$  in  $Y$ .
- d)  $f^{-1}(F)$  is  $\delta P_S$ -closed set in  $X$ , for each regular closed set  $F$  of  $Y$ .
- e)  $f^{-1}(V)$  is  $\delta P_S$ -open set in  $X$ , for each regular open set  $V$  of  $Y$ .

**Proof.** (a)  $\Rightarrow$  (b). Let  $V$  be any open set in  $Y$ . We have to show that  $f^{-1}(\text{Int}(Cl(V)))$  is a  $\delta P_S$ -open set in  $X$ . Let  $x \in f^{-1}(\text{Int}(Cl(V)))$  and  $\text{Int}(Cl(V))$  is a regular open set in  $Y$ . Since  $f$  is almost  $\delta P_S$ -continuous, by Proposition 3.9, there exists a  $\delta P_S$ -open set  $U$  of  $X$  containing  $x$  such that  $f(U) \subseteq \text{Int}(Cl(V))$ , which implies that  $x \in U \subseteq f^{-1}(\text{Int}(Cl(V)))$ . Therefore,  $f^{-1}(\text{Int}(Cl(V)))$  is  $\delta P_S$ -open set in  $X$ .

(b)  $\Rightarrow$  (c). Let  $F$  be any closed set of  $Y$ . Then  $Y - F$  is an open set of  $Y$ . By (b),  $f^{-1}(\text{Int}(Cl(Y \setminus F)))$  is  $\delta P_S$ -open set in  $X$  and  $f^{-1}(\text{Int}(Cl(Y \setminus F))) = f^{-1}(\text{Int}(Y \setminus F)) = f^{-1}(Y \setminus Cl(\text{Int}(F))) = X \setminus f^{-1}(Cl(\text{Int}(F)))$  is  $\delta P_S$ -open set in  $X$  and hence  $f^{-1}(Cl(\text{Int}(F)))$  is  $\delta P_S$ -closed set in  $X$ .

(c)  $\Rightarrow$  (d). Let  $F$  be any regular closed set of  $Y$ . Then  $F$  is a closed set of  $Y$ . By (c),  $f^{-1}(Cl(\text{Int}(F)))$  is  $\delta P_S$ -closed set in  $X$ . Since  $F$  is regular closed set, then  $f^{-1}(Cl(\text{Int}(F))) = f^{-1}(F)$ . Therefore,  $f^{-1}(F)$  is  $\delta P_S$ -closed set in  $X$ .

(d)  $\Rightarrow$  (e). Let  $V$  be any regular open set of  $Y$ . Then  $Y \setminus V$  is regular closed set of  $Y$  and by (d), we have  $f^{-1}(Y \setminus V) = X \setminus f^{-1}(V)$  is  $\delta P_S$ -closed set in  $X$  and hence  $f^{-1}(V)$  is  $\delta P_S$ -open in  $X$ .

(e)  $\Rightarrow$  (a). Let  $x \in X$  and let  $V$  be any regular open set of  $Y$  containing  $f(x)$ . Then  $x \in f^{-1}(V)$ . By (e), we have  $f^{-1}(V)$  is a  $\delta P_S$ -open set in  $X$ . Therefore, we obtain  $f(f^{-1}(V)) \subseteq V$ . Hence by Proposition 3.9,  $f$  is almost

$\delta P_S$ -continuous.

The following result can be proved easily from the above Proposition.

**Proposition 3.11.** If  $f$  is almost  $\delta P_S$ -continuous then  $f^{-1}(F)$  is a  $\delta P_S$ -closed set for each clopen set  $F$ .

**Proof:** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be almost  $\delta P_S$ -continuous and  $F$  be a clopen set. By (c) of Proposition 3.10,  $f^{-1}(Cl(int(F)))$  is  $\delta P_S$ -closed. Since every clopen set is open,  $int(F) = F$  and since  $F$  is closed we get  $Cl(int(F)) = Cl(F) = F$ .

$\therefore f^{-1}(F)$  is a  $\delta P_S$ -closed in  $X$ .

**Proposition 3.12.** For a function  $f: (X, \tau) \rightarrow (Y, \sigma)$ , the following statements are equivalent:

- a)  $f$  is almost  $\delta P_S$ -continuous.
- b)  $f(\delta P_S Cl(A)) \subseteq Cl_\delta f(A)$ , for each  $A \subseteq X$ .
- c)  $\delta P_S Cl f^{-1}(B) \subseteq f^{-1} Cl_\delta(B)$ , for each  $B \subseteq Y$ .
- d)  $f^{-1}(F)$  is  $\delta P_S$ -closed in  $X$ , for each  $\delta$ -closed set  $F$  of  $Y$ .
- e)  $f^{-1}(V)$  is  $\delta P_S$ -open set in  $X$ , each  $\delta$ -open set  $V$  of  $Y$ .
- f)  $f^{-1}(Int_\delta B) \subseteq \delta P_S f^{-1}(B)$ , for each  $B \subseteq Y$ .

**Proof.** (a)  $\Rightarrow$  (b). Let  $A$  be a subset of  $X$ . Since  $Cl_\delta f(A)$  is  $\delta$ -closed set in  $\delta P_S$ , so  $Cl_\delta f(A) = \bigcap \{F_\alpha : F_\alpha \in RC(Y), \alpha \in \Lambda\}$ , where  $\Lambda$  is an index set. Then  $A \subseteq f^{-1}(Cl_\delta f(A)) = f^{-1}(\bigcap \{F_\alpha : \alpha \in \Lambda\}) = \bigcap \{f^{-1}(F_\alpha) : \alpha \in \Lambda\}$ . By (a) and Proposition 3.10,  $f^{-1}(Cl_\delta f(A))$  is  $\delta P_S$ -closed set of  $X$ . Hence  $\delta P_S Cl(A) \subseteq f^{-1}(Cl_\delta f(A))$ . Therefore, we obtain that  $f(\delta P_S Cl(A)) \subseteq (Cl_\delta f(A))$ .

(b)  $\Rightarrow$  (c). Let  $B$  be any subset of  $Y$ . Then  $f^{-1}(B)$  is a subset of  $X$ . By (b), we have  $f(\delta P_S Cl f^{-1}(B)) \subseteq Cl_\delta(f(f^{-1}(B))) = Cl_\delta(B)$ . Hence  $\delta P_S Cl(f^{-1}(B)) \subseteq f^{-1}(Cl_\delta(B))$ .

(c)  $\Rightarrow$  (d). Let  $F$  be any  $\delta$ -closed set of  $Y$ . By (c), we have  $\delta P_S(Cl f^{-1}(F)) \subseteq f^{-1}(Cl_\delta F) = f^{-1}(F)$  and hence  $f^{-1}(F)$  is  $\delta P_S$ -closed set in  $X$ .

(d)  $\Rightarrow$  (e). Let  $V$  be any  $\delta$ -open set of  $Y$ . Then  $Y \setminus V$  is  $\delta$ -closed set of  $Y$  and by (d), we have  $f^{-1}(Y \setminus V) = X \setminus f^{-1}(V)$  is  $\delta P_S$ -closed set in  $X$ . Hence  $f^{-1}(V)$  is  $\delta P_S$ -open set in  $X$ .

(e)  $\Rightarrow$  (f). For each subset  $B$  of  $Y$ . We have  $Int_\delta B \subseteq B$ . Then  $f^{-1}(Int_\delta B) \subseteq f^{-1}(B)$ . By (e),  $f^{-1}(Int_\delta B)$  is  $\delta P_S$ -open set in  $X$ . Then  $f^{-1}(Int_\delta B) \subseteq \delta P_S Int f^{-1}(B)$ .

(f)  $\Rightarrow$  (a). Let  $x \in X$  and  $V$  be any regular open set of  $Y$  containing  $x$ . Hence  $V$  is  $\delta$ -open.

$$\therefore \delta int(V) = V \longrightarrow (1)$$

Moreover, by (f),  $f^{-1}(\delta int(V)) \subseteq \delta P_S int(f^{-1}(V)) \longrightarrow (2)$

From (1) & (2),  $f^{-1}(V) \subseteq \delta P_S int f^{-1}(V)$

$\therefore f^{-1}(V)$  is a  $\delta P_S$ -open set in  $X$  which contains  $x$  and we know  $f(f^{-1}(V)) \subseteq V$ . Hence by Proposition 3.9 (c) we get  $f$  is almost  $\delta P_S$ -continuous.

**Proposition 3.13.** For a function  $f: (X, \tau) \rightarrow (Y, \sigma)$ , the following statements are equivalent:

- a)  $f$  is almost  $\delta P_S$ -continuous.
- b)  $\delta P_S Cl f^{-1}(V) \subseteq f^{-1}(Cl V)$ , for each  $\beta$ -open set  $V$  of  $Y$ .
- c)  $f^{-1}(Int F) \subseteq \delta P_S Int f^{-1}(F)$ , for each  $\beta$ -closed set  $F$  of  $Y$ .
- d)  $f^{-1}(Int F) \subseteq \delta P_S Int f^{-1}(F)$ , for each semi-closed set  $F$  of  $Y$ .

e)  $\delta P_S Cl f^{-1}(V) \subseteq f^{-1}(Cl V)$ , for each semi-open set  $V$  of  $Y$ .

**Proof.** (a)  $\Rightarrow$  (b). Let  $V$  be any  $\beta$ -open set of  $Y$ . It follows from Lemma 2.14(b) that  $Cl V$  is regular closed set in  $Y$ . Since  $f$  is almost  $\delta P_S$ -continuous, by Proposition 3.10(d),  $f^{-1}(Cl V)$  is  $\delta P_S$ -closed set in  $X$ . Therefore, we obtain  $f^{-1}(Cl(V) = \delta P_S f^{-1} Cl(V) \longrightarrow (1)$

Now  $V \subseteq Cl(V) \Rightarrow f^{-1}(V) \subseteq f^{-1}(Cl(V)) \Rightarrow \delta P_S Cl(f^{-1}(V)) = \delta P_S Cl(f^{-1} Cl(V)) = f^{-1} Cl(V)$  [ From (1)]

Hence  $\delta P_S Cl(f^{-1}(V) \subseteq f^{-1}(Cl(V))$ .

(b)  $\Rightarrow$  (c). Let  $F$  be any  $\beta$ -closed set of  $Y$ . Then  $Y \setminus F$  is  $\beta$ -open set of  $Y$  and by (b), we have  $\delta P_S Cl f^{-1}(Y \setminus F) \subseteq f^{-1}(Cl(Y \setminus F))$  and  $\delta P_S Cl(X \setminus f^{-1}(F)) \subseteq f^{-1}(Y \setminus Int F)$  and hence,  $X \setminus \delta P_S Int f^{-1}(F) \subseteq X \setminus f^{-1}(Int F)$ . Therefore,  $f^{-1}(Int F) \subseteq \delta P_S Int f^{-1}(F)$ .

(c)  $\Rightarrow$  (d). Obvious since every semi-closed set is  $\beta$ -closed.

(d)  $\Rightarrow$  (e). Let  $V$  be any semi-open set of  $Y$ . Then  $Y \setminus V$  is semi-closed set in  $Y$  and by (d), we have  $f^{-1}(Int(Y \setminus V)) \subseteq \delta P_S Int f^{-1}(Y \setminus V)$  and  $f^{-1}(Y \setminus Cl V) \subseteq \delta P_S Int(X \setminus f^{-1}(V))$  and hence,  $X \setminus f^{-1}(Cl V) \subseteq X \setminus \delta P_S Cl f^{-1}(V)$ . Therefore,  $\delta P_S Cl f^{-1}(V) \subseteq f^{-1}(Cl V)$ .

(e)  $\Rightarrow$  (a). Let  $F$  be any regular closed set of  $Y$ . Then  $F$  is a semi-open set of  $Y$ . By (e), we have  $\delta P_S Cl f^{-1}(F) \subseteq f^{-1}(Cl F) = f^{-1}(F)$  [Since every regular closed set is closed]. This shows that  $f^{-1}(F)$  is a  $\delta P_S$ -closed set in  $X$ . Therefore, by Proposition 3.10(d),  $f$  is almost  $\delta P_S$ -continuous.

**Corollary 3.14.** For a function  $f: (X, \tau) \rightarrow (Y, \sigma)$ , the following statements are equivalent:

- a)  $f$  is almost  $\delta P_S$ -continuous.
- b)  $\delta P_S Cl(f^{-1}(V) \subseteq f^{-1}(\alpha Cl(V))$ , for each  $\beta$ -open set  $V$  of  $Y$ .
- c)  $\delta P_S Cl(f^{-1}(V) \subseteq f^{-1}(Cl_\delta(V))$ , for each  $\beta$ -open set  $V$  of  $Y$ .
- d)  $\delta P_S Cl(f^{-1}(V) \subseteq f^{-1}(\delta P_S Cl(V))$ , for each semi-open set  $V$  of  $Y$ .
- e)  $\delta P_S Cl(f^{-1}(V) \subseteq f^{-1}(p Cl(V))$ , for each semi-open set  $V$  of  $Y$ .

**Proof.** (a)  $\Rightarrow$  (b). Follows from Proposition 3.13 and Lemma 2.15[b]

(b)  $\Rightarrow$  (c). Follows from the fact that  $\alpha Cl V \subseteq Cl_\delta V$ .

(c)  $\Rightarrow$  (d) and (d)  $\Rightarrow$  (e). Follows from Proposition 3.13 and Lemma 2.15[a].

(e)  $\Rightarrow$  (f). Follows from Proposition 3.13 and Lemma 2.15[a].

The following result also can be concluded directly.

**Corollary 3.15.** For a function  $f: (X, \tau) \rightarrow (Y, \sigma)$ , the following statements are equivalent:

- a)  $f$  is almost  $\delta P_S$ -continuous.
- b)  $f^{-1}(\alpha Int F) \subseteq \delta P_S Int f^{-1}(F)$ , for each  $\beta$ -closed set  $F$  of  $Y$ .
- c)  $f^{-1}(Int_\delta F) \subseteq \delta P_S Int f^{-1}(F)$ , for each  $\beta$ -closed set  $F$  of  $Y$ .
- d)  $f^{-1}(\delta P_S Int F) \subseteq \delta P_S Int f^{-1}(F)$ , for each semi-closed set  $F$  of  $Y$ .
- e)  $f^{-1}(p Int F) \subseteq \delta P_S Int f^{-1}(F)$ , for each semi-closed set  $F$  of  $Y$ .

**Proposition 3.16.** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is almost  $\delta P_S$ -continuous if and only if

$f^{-1}(V) \subseteq \delta P_S Int f^{-1}(Int Cl V)$  for each preopen set  $V$  of  $Y$ .

**Proof.** Necessity. Let  $V$  be any preopen set of  $Y$ . Then  $V \subseteq Int Cl V$  and  $Int Cl V$  is a regular open set in  $Y$ . Since  $f$  is almost  $\delta P_S$ -continuous, by Proposition 3.10(e),  $f^{-1}(Int Cl V)$  is  $\delta P_S$ -open set in  $X$  and hence we obtain that  $f^{-1}(V) \subseteq f^{-1}(Int Cl V) = \delta P_S Int f^{-1}(Int Cl V)$ .

Sufficiency. Let  $V$  be any regular open set of  $Y$ . Then  $V$  is a preopen set of  $Y$ . By hypothesis, we have  $f^{-1}(V) \subseteq \delta P_S \text{Int } f^{-1}(\text{IntCl}V) = \delta P_S \text{Int } f^{-1}(V)$ . Therefore,  $f^{-1}(V)$  is  $\delta P_S$ -open set in  $X$  and hence by Proposition 3.10(e),  $f$  is almost  $\delta P_S$ -continuous.

We obtain the following corollary.

**Corollary 3.17.** The following statements are equivalent for a function  $f: (X, \tau) \rightarrow (Y, \sigma)$ :

- a)  $f$  is almost  $\delta P_S$ -continuous.
- b)  $f^{-1}(V) \subseteq \delta P_S \text{Int } f^{-1}(s\text{Cl}V)$  for each preopen set  $V$  of  $Y$
- c)  $\delta P_S \text{Cl } f^{-1}(\text{ClInt}F) \subseteq f^{-1}(F)$  for each preclosed set  $F$  of  $Y$ .
- d)  $\delta P_S \text{Cl } f^{-1}(s\text{Int}F) \subseteq f^{-1}(F)$  for each preclosed set  $F$  of  $Y$ .

**Corollary 3.18.** For a function  $f: (X, \tau) \rightarrow (Y, \sigma)$ , the following statements are equivalent:

- a)  $f$  is almost  $\delta P_S$ -continuous.
- b) For each neighborhood  $V$  of  $f(x), x \in \delta P_S \text{Int } f^{-1}(s\text{Cl}V)$ .
- c) For each neighborhood  $V$  of  $f(x), x \in \delta P_S \text{Int } f^{-1}(\text{IntCl}V)$ .

**Proof.** Follows from Proposition 3.16 and Corollary 3.17.

**Proposition 3.19.** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be an almost  $\delta P_S$ -continuous function and let  $V$  be any open subset of  $Y$ . If  $x \in \delta P_S \text{Cl } f^{-1}(V) \setminus f^{-1}(V)$ , then  $f(x) \in \delta P_S \text{Cl } V$ .

**Proof.** Let  $x \in X$  be such that  $x \in \delta P_S \text{Cl } f^{-1}(V) \setminus f^{-1}(V)$  and suppose  $f(x) \notin \delta P_S \text{Cl } V$ . Then there exists a  $\delta P_S$ -open set  $H$  containing  $f(x)$  such that  $H \cap V = \emptyset$ . Then  $\text{Cl } H \cap V = \emptyset$  implies  $\text{IntCl}H \cap V = \emptyset$  and  $\text{IntCl}H$  is a regular open set. Since  $f$  is almost  $\delta P_S$ -continuous, by Proposition 3.9(c), there exists a  $\delta P_S$ -open set  $U$  in  $X$  containing  $x$  such that  $f(U) \subseteq \text{IntCl}H$ . Therefore,  $f(U) \cap V = \emptyset$ . However, since  $x \in \delta P_S \text{Cl } (f^{-1}(V))$ ,  $U \cap f^{-1}(V) \neq \emptyset$  for every  $\delta P_S$ -open set  $U$  in  $X$  containing  $x$ , so that  $f(U) \cap V \neq \emptyset$ . We have a contradiction. It follows that  $f(x) \in \delta P_S \text{Cl } V$ .

**Proposition 3.20.** If a function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is almost precontinuous. Then the following statements are equivalent:

- a)  $f$  is almost  $\delta P_S$ -continuous.
- b) For each  $x \in X$  and each open set  $V$  of  $Y$  containing  $f(x)$ , there exists a semi-closed set  $F$  in  $X$  containing  $x$  such that  $f(F) \subseteq \text{Int } \delta \text{Cl}V$ .
- c) For each  $x \in X$  and each open set  $V$  of  $Y$  containing  $f(x)$ , there exists a semi-closed set  $F$  in  $X$  containing  $x$  such that  $f(F) \subseteq s\text{Cl}V$ .
- d) For each  $x \in X$  and each regular open set  $V$  of  $Y$  containing  $f(x)$ , there exists a semi-closed set  $F$  in  $X$  containing  $x$  such that  $f(F) \subseteq V$ .
- e) For each  $x \in X$  and each  $\delta$ -open set  $V$  of  $Y$  containing  $f(x)$ , there exists a semi-closed set  $F$  in  $X$  containing  $x$  such that  $f(F) \subseteq V$ .

**Proof.** (a)  $\Rightarrow$  (b). Let  $x \in X$  and let  $V$  be any open set of  $Y$  containing  $f(x)$ . By (a), there exists a  $\delta P_S$ -open set  $U$  of  $X$  containing  $x$  such that  $f(U) \subseteq \text{Int } \delta \text{Cl } V$ . Since  $U$  is  $\delta P_S$ -open set, so for each  $x \in U$  there exists a semi-closed set  $F$  in  $X$  such that  $x \in F \subseteq U$ . Therefore, we have  $f(F) \subseteq \text{Int } \delta \text{Cl}V$ .

(b)  $\Rightarrow$  (c). Obvious as  $\text{IntCl}(V) \subseteq s\text{Cl}(V)$ .

(c)  $\Rightarrow$  (d). Let  $x \in X$  and let  $V$  be any regular open set of  $Y$  containing  $f(x)$ . Then  $V$  is an open set of  $Y$  containing  $f(x)$ . By (c), there exists a semi-closed set  $F$  in  $X$  containing  $x$  such that  $f(F) \subseteq_s \text{Cl}V$ . Since  $V$  is regular open and hence is preopen. Therefore, by Lemma 2.14[a],  $f(F) \subseteq \text{IntCl}V$ . Since  $V$  is regular open, then  $f(F) \subseteq V$ .

(d)  $\Rightarrow$  (e). Let  $x \in X$  and let  $V$  be any  $\delta$ -open set of  $Y$  containing  $f(x)$ . Then for each  $f(x) \in V$ , there exists an open set  $G$  containing  $f(x)$  such that  $G \subseteq \text{IntCl}G \subseteq V$ . Since  $\text{IntCl}G$  is a regular open set of  $Y$  containing  $f(x)$ , by (d), there exists a semi-closed set  $F$  in  $X$  containing  $x$  such that  $f(F) \subseteq \text{IntCl}G \subseteq V$ . This completes the proof.

(e)  $\Rightarrow$  (a). Let  $V$  be any  $\delta$ -open set of  $Y$ . We have to show that  $f^{-1}(V)$  is  $\delta P_S$ -open set in  $X$ . Since  $f$  is almost precontinuous, by Proposition 2.17(c),  $f^{-1}(V)$  is preopen set in  $X$ . Since every preopen set is  $\delta$ -preopen we get  $f^{-1}(V)$  is  $\delta$ -preopen. Let  $x \in f^{-1}(V)$ , then  $f(x) \in V$ . By (e), there exists a semi-closed set  $F$  of  $X$  containing  $x$  such that  $f(F) \subseteq V$ . Which implies that  $x \in F \subseteq f^{-1}(V)$ . Therefore,  $f^{-1}(V)$  is  $\delta P_S$ -open set in  $X$ . Hence by Proposition 3.12(e),  $f$  is almost  $\delta P_S$ -continuous.

**Proposition 3.21.** A function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is almost  $\delta P_S$ -continuous if and only if  $f: (X, \tau) \rightarrow (Y, \sigma_s)$  is  $\delta P_S$ -continuous.

**Proof.** Necessity. Let  $H \in \sigma_s$ , then  $H$  is a regular open set in  $(Y, \sigma)$ . Since  $f: (X, \tau) \rightarrow (Y, \sigma)$  is almost  $\delta P_S$ -continuous, by Proposition 3.10(e),  $f^{-1}(H)$  is  $\delta P_S$ -open set in  $X$ . Therefore,  $f: (X, \tau) \rightarrow (Y, \sigma_s)$  is  $\delta P_S$ -continuous.

Sufficiency. Let  $G$  be any regular open set in  $(Y, \sigma)$ . Then  $G \in \sigma_s$ . Since  $f: (X, \tau) \rightarrow (Y, \sigma_s)$  is  $\delta P_S$ -continuous, by Definition 2.16,  $f^{-1}(G)$  is  $\delta P_S$ -open set in  $X$ . Therefore, by Proposition 3.10(e),  $f: (X, \tau) \rightarrow (Y, \sigma)$  is almost  $\delta P_S$ -continuous.

**Proposition 3.22.** Let  $X$  be a locally indiscrete space. Then the function  $f: (X, \tau) \rightarrow (Y, \sigma)$  is almost  $\delta P_S$ -continuous if and only if  $f: (X, \tau) \rightarrow (Y, \sigma_s)$  is continuous.

**Proof.** Necessity. Let  $H \in \sigma_s$ , then  $H$  is a regular open set in  $(Y, \sigma)$ . Since  $f: (X, \tau) \rightarrow (Y, \sigma)$  is almost  $\delta P_S$ -continuous, by Proposition 3.10(e),  $f^{-1}(H)$  is  $\delta P_S$ -open set in  $X$ . Since  $X$  is locally indiscrete space, by Proposition 2.11(c),  $f^{-1}(H)$  is open set in  $X$ . Therefore,  $f: (X, \tau) \rightarrow (Y, \sigma_s)$  is continuous.

Sufficiency. Let  $G$  be any regular open set in  $(Y, \sigma)$ . Then  $G \in \sigma_s$ . Since  $f: (X, \tau) \rightarrow (Y, \sigma_s)$  is continuous, so  $f^{-1}(G)$  is open set in  $X$ . Since  $X$  is locally indiscrete space, by Proposition 2.11(c),  $f^{-1}(G)$  is  $\delta P_S$ -open set in  $X$ . Therefore, by Proposition 3.10(e),  $f: (X, \tau) \rightarrow (Y, \sigma)$  is almost  $\delta P_S$ -continuous.

**Corollary 3.23.** If  $f: (X, \tau) \rightarrow (Y, \sigma)$  is almost  $\delta P_S$ -continuous function if and only if  $f$  is almost continuous where  $X$  is locally indiscrete space.

**The following is the pasting lemma for almost  $\delta P_S$ -continuity**

**Proposition 4.7.** Let  $X = R_1 \cup R_2$ , where  $R_1$  and  $R_2$  are regular open sets in  $X$ . Let  $f: R_1 \rightarrow Y$  and  $g: R_2 \rightarrow Y$  be almost  $\delta P_S$ -continuous. If  $f(x) = g(x)$  for each  $x \in R_1 \cap R_2$ . Then  $h: R_1 \cup R_2 \rightarrow Y$  such that  $h(x) = f(x)$  for  $x \in R_1$  and  $h(x) = g(x)$  for  $x \in R_2$  is almost  $\delta P_S$ -continuous.

**Proof.** Let  $O$  be a regular open set of  $Y$ . Now  $h^{-1}(O) = f^{-1}(O) \cup g^{-1}(O)$ . Since  $f$  and  $g$  are almost  $\delta P_S$ -continuous, by Proposition 3.10(e),  $f^{-1}(O)$  and  $g^{-1}(O)$  are  $\delta P_S$ -open set in  $R_1$  and  $R_2$  respectively. But  $R_1$  and  $R_2$  are both regular open sets in  $X$ . Then by Lemma 2.13(c),  $f^{-1}(O)$  and  $g^{-1}(O)$  are  $\delta P_S$ -open sets in  $X$ . Since union of two  $\delta P_S$ -open sets is  $\delta P_S$ -open, so  $h^{-1}(O)$  is a  $\delta P_S$ -open set in  $X$ . Hence by Proposition 3.10(e),  $h$  is almost  $\delta P_S$ -continuous.

**Proposition 4.8.** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be almost  $\delta P_S$ -continuous surjection and  $A$  be either  $\delta$ -open or regular semi-open subset of  $X$ . If  $f$  is an open function, then the function  $g: A \rightarrow f(A)$ , defined by  $g(x) = f(x)$  for each  $x \in A$ , is almost  $\delta P_S$ -continuous.

**Proof.** Suppose that  $H = f(A)$ . Let  $x \in A$  and  $V$  be any open set in  $H$  containing  $g(x)$ . Since  $H$  is open in  $Y$  and  $V$  is open in  $H$ , so  $V$  is open in  $Y$ . Since  $f$  is almost  $\delta P_S$ -continuous, hence there exists a  $\delta P_S$ -open set  $U$  in  $X$  containing  $x$  such that  $f(U) \subseteq \text{Int}(\delta Cl(V))$ . Taking  $W = U \cap A$ , since  $A$  is either open or regular semi-open subset of  $X$ , by Lemma 2.13(d),  $W$  is a  $\delta P_S$ -open set in  $A$  containing  $x$  and  $g(W) \subseteq \text{Int}_Y Cl_Y(V) \cap H = \text{Int}_H Cl_H(V)$ . Then  $g(W) \subseteq \text{Int}_H Cl_H(V)$ . This shows that  $g$  is almost  $\delta P_S$ -continuous.

**Proposition 4.9.** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  be almost  $\delta P_S$ -continuous. If  $Y$  is a preopen subset of  $Z$ , then  $f: (X, \tau) \rightarrow (Z, \eta)$  is almost  $\delta P_S$ -continuous.

**Proof.** Let  $V$  be any regular open set of  $Z$ . Since  $Y$  is preopen, by Lemma 2.12(a),  $V \cap Y$  is a regular open set in  $Y$ . Since  $f: X \rightarrow Y$  is almost  $\delta P_S$ -continuous, by Proposition 3.10(e),  $f^{-1}(V \cap Y)$  is a  $\delta P_S$ -open set in  $X$ . But  $f(x) \in Y$  for each  $x \in X$ . Thus  $f^{-1}(V) = f^{-1}(V \cap Y)$  is a  $\delta P_S$ -open set of  $X$ . Therefore, by Proposition 3.10,  $f: (X, \tau) \rightarrow (Z, \eta)$  is almost  $\delta P_S$ -continuous.

**Proposition 4.10.** Let  $f: (X, \tau) \rightarrow (Y, \sigma)$  and  $g: (Y, \sigma) \rightarrow (Z, \eta)$  be functions. Then the composition function  $g \circ f: (X, \tau) \rightarrow (Z, \eta)$  is almost  $\delta P_S$ -continuous if  $f$  and  $g$  satisfy one of the following conditions:

- a)  $f$  is  $\delta P_S$ -continuous and  $g$  is almost continuous.
- b)  $f$  is almost  $\delta P_S$ -continuous and  $g$  is  $\delta$ -continuous.
- c)  $f$  is continuous and open and  $g$  is almost  $\delta P_S$ -continuous.

**Proof.** (a). Let  $W$  be any regular open subset of  $Z$ . Since  $g$  is almost continuous,  $(g)^{-1}(W)$  is open subset of  $Y$ . Since  $f$  is  $\delta P_S$ -continuous, by Definition 2.17,  $(g \circ f)^{-1}(W) = f^{-1}(g^{-1}(W))$  is  $\delta P_S$ -open subset in  $X$ . Therefore, by Proposition 3.10(e),  $g \circ f$  is almost  $\delta P_S$ -continuous.

(b). Let  $W$  be any  $\delta$ -open subset of  $Z$ . Since  $g$  is  $\delta$ -continuous,  $(g)^{-1}(W)$  is  $\delta$ -open subset of  $Y$ . Since  $f$  is almost  $\delta P_S$ -continuous, by Proposition 3.12(e),  $(g \circ f)^{-1}(W) = f^{-1}(g^{-1}(W))$  is  $\delta P_S$ -open subset in  $X$ . Therefore, by Proposition 3.12(e),  $g \circ f$  is almost  $\delta P_S$ -continuous.

(c). Let  $W$  be any regular open subset of  $Z$ . Since  $g$  is almost  $\delta P_S$ -continuous, by Proposition 3.10(e),  $(g)^{-1}(W)$  is  $\delta P_S$ -open subset of  $Y$ . Since  $f$  is continuous and open, by Proposition 2.22,  $f^{-1}(g^{-1}(W)) = (g \circ f)^{-1}(W)$  is a  $\delta P_S$ -open set in  $X$ . Hence by Proposition 3.10(e),  $g \circ f$  is almost  $\delta P_S$ -continuous.
